Bernstein's Construction of Movements Mark L. Latash, 2020-10-29 Nikolai Aleksandrovich Bernstein was one of the great neuroscientists of the twentieth century and highly respected by Western scientists even though most have never read his most important book entitled *On the Construction of Movements* Bernstein's *Construction of Movements: The Original Text and Commentaries* is the first English translation. It supplements the translated text with a series of commentaries by scientists who knew Bernstein personally as well as leaders in related fields including physics, motor control, and biomechanics. While written in 1947, Bernstein's book is anything but obsolete, making this English translation and accompanying commentaries an invaluable text. The translated original text presents in detail Bernstein's views on the evolutionary history of biological movement and his multi-level hierarchical scheme of the construction of movements in higher animals including humans. The following commentaries address Bernstein's personality, the history of the book, and current views on different aspects of neuroscience covered in Bernstein's text. Ultimately, they present a book within the book to showcase how Bernstein's heritage has developed over the past years. This classic, available for the first time to an English-speaking audience, will prove beneficial to students, instructors, and experts of neuroscience, physics, neurophysiology, motor control, motor rehabilitation, biomechanics, dynamical systems, and related fields.

The integration of multisensory information is an essential mechanism in perception and in controlling actions Research in multisensory integration is concerned with how the information from the different sensory modalities such as the senses of vision hearing smell taste touch and proprioception are integrated to a coherent representation of objects Multisensory integration is central for action control For instance when you grasp for a rubber duck you can see its size and hear the sound it produces Moreover identical physical properties of an object can be provided by different senses You can both see and feel the size of the rubber duck Even when you grasp for the rubber duck with a tool e.g. with tongs the information from the hand from the effect points of the tool and from the eyes are integrated in a manner to act successfully Over the recent decade a surge of interest in multisensory integration and action control has been witnessed especially in connection with the idea that multiple sensory sources are integrated in an optimized way For this perspective to mature it will be helpful to delve deeper into the information processing mechanisms and their neural correlates asking about the range and constraints of this mechanisms about its localization and involved networks
