Radiobiology in Radiotherapy Norman M. Bleehen, 2012-12-06 The ninth annual multidisciplinary symposium on clinical oncology organized by the Royal College of Radiologists was jointly arranged with the International Society for Radiation Oncology It was held in London in February 1987 and discussed the biological and clinical basis of the effects of radiotherapy Wherever possible lectures by an experimental scientist were paired with those of a clinical scientist in order to emphasize clinical relevance It is hoped that this has resulted in a widely balanced view of the subject The volume presents an updated version of these subjects based on those talks After surgery radiotherapy is the main treatment used in the management of patients with cancer Its empirical success when first introduced is now backed up by a wealth of laboratory clinical and experimental experience New techniques for administering the conventional X ray therapy have been supplemented by methods which can be used to modify the radiation response These include changes in dose rate or fractionation and combined modality treatments including sensitization by drugs or heat Other types of radiation such as neutrons and other particles are also now available which have enhanced physical and biological advantages

Radiation Oncology of Gynecological Cancers Helmut W. Vahrson, 2012-12-06 The incidence, diagnosis

and treatment of gynecologic cancer have undergone major changes during the past 20 years. In addition to significant changes in the incidence of the diseases, there has been extensive application of new technologies in the field. While the incidence of invasive cancers of the cervix has diminished sharply, there has been a marked increase in the number of patients presenting with in situ carcinomas of the cervix. This has resulted primarily from better education but also from the regular use of Papanicolaou screening for early diagnosis. This trend has been associated with a major shift from late stage disease to early stage disease, which has led to more effective utilization of surgical techniques in primary management with less emphasis on radiation therapy techniques. Almost invariably in situ cancers of the cervix can be cured by surgical management and high cure rates can be achieved by surgical techniques in early invasive cancers of the cervix. Therefore, more patients are receiving definitive surgical management rather than definitive radiation therapy management. Because of its tendency to present at an early stage, cancer of the endometrium is now more commonly managed by surgical techniques. Postoperative radiation therapy is used when there is persistent residual disease following surgery, a more advanced disease stage than indicated by preliminary study, transection or spillage of tumor during the operative procedure, or positive cytology at the time of the original surgery.

Radiation and the Immune System: Current Knowledge and Future Perspectives Katalin Lumnitzky,Serge M. Candéias,Udo S. Gaipl,Benjamin Frey,2018-05-03 For long high dose ionizing radiation was considered as a net immune suppressing agent as shown among others by the exquisite radiosensitivity of the lymphoid system to radiation induced cell killing However recent advances in radiobiology and immunology have made this picture more complex For example the recognition that radiation induced bystander effects share common mediators with various immunological signalling processes suggests that they are at least partly immune mediated Another milestone was the finding in the field of onco immunology that local tumor irradiation can modulate the immunogenicity of tumor cells and the anti tumor immune responsiveness both locally in the tumor microenvironment and at systemic level These observations paved the way for studies exploring optimal combinations of radiotherapy and immunotherapy in order to achieve a synergistic effect to eradicate tumors However not all interactions between radiation and the immune system are beneficial as it was recognized

that many of radiation induced late side effects are also of immune and inflammatory nature. Currently perhaps the most studied field of research in radiation biology is focused around the biological effects of low doses where many of the observed pathophysiological endpoints are due to mechanisms other than direct radiation induced cell killing and are immune related. Finally it must not be forgotten that the interactions between the ionizing radiations and the immune system are bidirectional and activation of the immune system also influences the outcome of radiation exposure. This Research Topic brings together 23 articles and aims to give an overview of the complex and very often contradictory nature of the interactions between ionizing radiation and the immune system. Due to its increasing penetrance in the population both through medical diagnostic or environmental sources or during cosmic travel low dose ionizing radiation exposure is becoming a major epidemiological concern world wide. Several of the articles within the Research Topic specifically address potential long term health consequences and the underlying mechanisms of low dose radiation exposure. A major intention of the Editors was also to draw the attention of the non radiobiological scientific community on the fact that ionizing radiation is by far more than purely an immune suppressing agent.
