Electromechanical Sensors and Actuators Ilene J. Busch-Vishniac,2012-12-06 Mechanical engineering an engineering discipline borne of the needs of the industrial revolution is once again asked to do its substantial share in the call for industrial renewal The general call is urgent as we face profound issues of productivity and competitiveness that require engineering solutions among oth ers The Mechanical Engineering Series features graduate texts and research monographs intended to address the need for information in contemporary areas of mechanical engineering The series is conceived as a comprehensive one that covers a broad range of concentrations important to mechanical engineering graduate education and research We are fortunate to have a distinguished roster of consulting editors on the advisory board each an expert in one of the areas of concentration The names of the consulting editors are listed on the facing page of this volume The areas of concentration are applied mechanics biomechanics computational mechanics dynamic systems and control energetics mechanics of materials processing thermal science and tribology I am pleased to present this volume in the Series

Electromechanical Sensors and Actuators by Ilene Busch Vishniac The selection of this volume under scores again the interest of the Mechanical Engineering series to provide our readers with topical monographs as well as graduate texts in a wide variety of fields Robotics Joseph A. Angelo Jr.,2006-12-30 Although advanced technologies are the cornerstone of modern life few people understand how such technologies as robotics or nuclear science actually work Fewer still realize how and how dramatically technology influences our society and culture Robotics is a reference guide that provides nonspecialists with the most up to date information on seminal developments in the technology of robotics as well as covering the social political and technical impacts of those developments on everyday life both now and in the future

Robot Components and Systems François Lhôte,Pierre André,Jean-Pierre Taillard,Jean-Marie Kauffmann,2013-03-09 The contemporary industrial robot is the focal point of a wide variety of elements in modern technology It is a collection of parts some of which act as drives and some of which act as architectural materials that give the robot body strength This book is a thorough inventory of the technologies involved and the way in which they meet and work together in order to produce a functional robot arm The authors have striven to describe thoroughly the components that make up robot arms This gives both the student and the practitioner a complete view of the principles involved in such components and the differences between existing technologies However it is not only the student who benefits from this approach but also the potential robot user who at the moment may be faced with a bewildering choice of combinations of different types of components in the robots that are available to him For example it is difficult for a production manager to appreciate the differences between robots that use direct current motors stepping motors and pneumatic actuators The authors have succeeded in structuring the book so that the reader can weigh up the pros and cons of these different techniques at whatever level of depth he requires Certainly the book aims to provide as much depth as there is in these topics without assuming a detailed knowledge of specialized areas of engineering
