**Bioconsensus** Melvin F. Janowitz, This volume is based on two DIMACS working group meetings on Bioconsensus It provides a valuable introduction and reference to the various aspects of this rapidly developing field The meetings brought together mathematical and biological scientists to discuss the uses in the biological sciences of methods of consensus and social choice These two lively meetings contributed much toward establishing the new field of bioconsensus Yet this book is much more than just a report of two meetings It includes some historical background as well as a substantial introduction to the axiomatic foundations of the field of bioconsensus and some practical applications of consensus methods to real data Also included are contributed papers from experts who were not at the meetings The book is intended for mathematical biologists evolutionary biologists and computer scientists

*Constraint Programming and Large Scale Discrete Optimization* Eugene C. Freuder, 2001 The proceedings of the September 1998 workshop deals with the application of constraint programming to problems of combinatorial optimization and industrial practice covering general techniques scheduling problems and software methodology The eight papers discuss using global constraints for local search multithreaded constraint programming employee scheduling mission scheduling on orbiting satellites sports scheduling and the main results of the CHIC 2 project on large scale constraint optimization No index c Book News Inc

*Graphs, Morphisms, and Statistical Physics* Jaroslav Nešetřil, Peter Winkler, The intersection of combinatorics and statistical physics has experienced great activity in recent years This flurry of activity has been fertilized by an exchange not only of techniques but also of objectives Computer scientists interested in approximation algorithms have helped statistical physicists and discrete mathematicians overcome language problems They have found a wealth of common ground in probabilistic combinatorics Close connections between percolation and random graphs graph morphisms and hard constraint models and slow mixing and phase transition have led to new results and perspectives These connections can help in understanding typical behavior of combinatorial phenomena such as graph coloring and homomorphisms Inspired by issues and intriguing new questions surrounding the interplay of combinatorics and statistical physics a DIMACS DIMATIA workshop was held at Rutgers University These proceedings are the outgrowth of that meeting This volume is intended for graduate students and research mathematicians interested in probabilistic graph theory and its applications

**Building Scalable Network**

**Services** Cheng Jin, Sugih Jamin, Danny Raz, Yuval Shavitt, 2012-12-06 Building Scalable Network Services Theory and Practice is on building scalable network services on the Internet or in a network service provider's network. The focus is on network services that are provided through the use of a set of servers. The authors present a tiered scalable network service model and evaluate various services within this architecture. The service model simplifies design tasks by implementing only the most basic functionalities at lower tiers where the need for scalability dominates functionality. The book includes a number of theoretical results that are practical and applicable to real networks such as building network wide measurement monitoring services and strategies for building better P2P networks. Various issues in scalable system design and placement algorithms for service nodes are discussed. Using existing network services as well as potentially new but useful services as examples, the authors formalize the problem of placing service nodes and provide practical solutions for them. *Algebraic Coding Theory and Information Theory* Alexei Ashikhmin, Alexander Barg, 2005 In these papers associated with the workshop of December 2003 contributors describe their work in fountain codes for lossless data compression, an application of coding theory to universal lossless source coding, performance bounds, expander graphs and codes, multilevel expander codes, low parity check lattices, sparse factor graph representations of Reed Solomon and related codes, Interpolation multiplicity assignment algorithms for algebraic soft decision decoding of Reed Solomon codes, the capacity of two dimensional weight constrained memories, networks of two way channels and a new approach to the design of digital communication systems. Annotation 2005 Book News Inc Portland OR booknews.com *BioMath in the Schools* Margaret B. Cozzens, Fred S. Roberts, 2011 Even though contemporary biology and mathematics are inextricably linked, high school biology and mathematics courses have traditionally been taught in isolation. But this is beginning to change. This volume presents papers related to the integration of biology and mathematics in high school classes. The first part of the book provides the rationale for integrating mathematics and biology in high school courses as well as opportunities for doing so. The second part explores the development and integration of curricular materials and includes responses from teachers. Papers in the third part of the book explore the interconnections between biology and mathematics in light of new technologies in biology. The last paper in the book discusses what works and what doesn't and presents positive responses from students to the integration of mathematics and biology in their classes. **The Shortest Path Problem** Camil Demetrescu, Andrew V. Goldberg, David S. Johnson, **Geometric and Algorithmic Aspects of Computer-Aided Design and Manufacturing** Ravi Janardan, Michiel Smid, Debasish Dutta, 2005 Computer Aided Design and Manufacturing CAD/CAM is concerned with all aspects of the process of designing, prototyping, manufacturing, inspecting and maintaining complex geometric objects under computer control. As such, there is a natural synergy between this field and Computational Geometry (CG) which involves the design, analysis, implementation and testing of efficient algorithms and data representation techniques for geometric entities such as points, polygons, polyhedra, curves and surfaces. The DIMACS Center, Piscataway NJ, sponsored a workshop to further

promote the interaction between these two fields Attendees from academia research laboratories and industry took part in the invited talks contributed presentations and informal discussions This volume is an outgrowth of that meeting

**Discrete Mathematical Problems with Medical Applications** Dingzhu Du, Panos M. Pardalos, Jie Wang, 2000-01-01 This volume presents selected papers from a three day workshop held during the DIMACS special years on Mathematical Support for Molecular Biology Participants from the world over attended giving the workshop an important international component The study of discrete mathematics and optimization with medical applications is emerging as an important new research area Significant applications have been found in medical research for example in radiosurgical treatment planning virtual endoscopy and more This volume presents a substantive cross section of active research topics ranging from medical imaging to human anatomy modeling from gamma knife treatment planning to radiation therapy and from epileptic seizures to DNA screening This book is an up to date resource reflecting current research directions

**DNA Based Computers V** Erik Winfree, 2000 This proceedings volume presents the talks from the Fifth Annual Meeting on DNA Based Computers held at MIT The conference brought together researchers and theorists from many disciplines who shared research results in biomolecular computation Two styles of DNA computing were explored at the conference 1 DNA

computing based on combinatorial search where randomly created DNA strands are used to encode potential solutions to a problem and constraints induced by the problem are used to identify DNA strands that are solution witnesses and 2 DNA computing based on finite state machines where the state of a computation is encoded in DNA which controls the biochemical steps that advance the DNA based machine from state to state Featured articles include discussions on the formula satisfiability problem self assembly and nanomachines simulation and design of molecular systems and new theoretical approaches     Modeling Paradigms and Analysis of Disease Transmission Models Abba B. Gumel,Suzanne Lenhart,2010 This volume stems from two DIMACS activities the U S Africa Advanced Study Institute and the DIMACS Workshop both on Mathematical Modeling of Infectious Diseases in Africa held in South Africa in the summer of 2007 It contains both tutorial papers and research papers Students and researchers should find the papers on modeling and analyzing certain diseases currently affecting Africa very informative In particular they can learn basic principles of disease modeling and stability from the tutorial papers where continuous and discrete time models optimal control and stochastic features are introduced
