Crystal Identification with the Polarizing Microscope R.E. Stoiber, S.A. Morse, 2012-12-06 Some of the simpler measurements of optical mineralogy are so precise and powerful that they give satisfaction to beginning students Not long after mastering the strike and dip of rock surfaces with the Brunton compass many geology students are able to determine precisely the identity of quartz or the anorthite content of plagioclase or the magnesium ratio of pyroxene with the polarizing or petrographic microscope by means of measuring refractive index to better than one part in a thousand Very little training and almost no theory are needed to achieve these skills But there inevitably comes a time when theory is needed either to get on with the art or simply to reconstruct from first principles what is going on when rote memory fails In this book we hope to provide both the rote methods and the theoretical background for practitioners at all levels of experience We draw from several careers ours our colleagues and our students in teaching the subject at various levels of sophistication Our book is intended to serve the needs of industrial and forensic scientists as well as petrographers who deal with rocks Much of our treatment is based on new research both in matters of presentation and in the optical determination of minerals and other materials
