Endocrine Immunology W. Savino, F. Guaraldi, 2017-02-28 In the last decades several in vitro and in vivo studies have revealed the existence of a very complex network between the neuroendocrine and immune system. Important molecular mechanisms underlying these interactions in both physiological and pathological conditions have also been described. Indeed, hormones play a pivotal role in the development and functional regulation of the immune system, both innate and acquired responses. Immune system cells present specific hormone receptors and themselves produce some hormones, thus influencing hormone secretion. More recently, the modulation of hormone secretion has been attempted for treating associated autoimmune disorders, further supporting the strong interplay between the endocrine and immune system. Distinguished experts who have published extensively in their fields have contributed comprehensive chapters to this volume. The focus is on the various aspects of endocrine-neuro-immune connections, providing an updated panorama from basics to clinical applications of current knowledge and still debated issues.

Medical and Health Care Books and Serials in Print, 1997 Reversibility of Chronic Degenerative Disease and Hypersensitivity, Volume 1 William J. Rea, Kalpana Patel, 2010-06-18 The clinical approaches to the chronic degenerative diseases that drain our resources and compromise our well-being have become almost exclusively symptom-focused. The common wisdom is that they are idiopathic with final outcomes to be managed rather than prevented or cured. That they are potentially reversible rarely enters into any discussion.

Hormones, Neurotransmitters, and T-Cell Development in Health and Disease Wilson Savino, Daniella Areas Mendes-da-Cruz, Ana Rosa Pérez, Vincent Geenen, 2019-11-01 Thymus physiology and T cell homeostasis are controlled by hormones, neurotransmitters, cytokines, and other factors that modulate stromal cell interactions, influence thymocyte development, and selection processes, survival, and migration. In the context of this Research Topic on Hormones, Neurotransmitters, and T cell development in Health and Disease, authors discuss the control of thymus physiology by glucocorticoids (GC), growth hormone (GH), and sex hormones (norepinephrine (NE) and other molecules that seem to impact upon thymocyte microenvironmental interactions like galectin 3 (Gal 3), ephrins (Eph), extracellular matrix proteins, and integrins like VLA 5. Moreover, some of them draw attention to how diverse maturation steps and/or the interactions between stromal and thymocytes can be affected in pathological states like diabetes or infections. As shown schematically in the figure, this topic highlights the following notions:

1. GH shows counterregulatory effects against GC rather than influence directly T cell homeostasis.
2. Interactions between sex hormones and noradrenergic secretion may influence thymus homeostasis and involution.
3. Gal 3 is crucial to thymocyte-stromal cell interactions and influence thymic architecture. Moreover, Gal 3 seems to be involved in the regulation of the steroidogenic pathway.
4. Ephrins are crucial to assemble the thymic connections between thymocytes and the epithelial network but have a relative importance in supporting normal thymopoiesis.
5. Pathologic situations like diabetes or infectious diseases caused by parasites or bacteria alter the normal development of T lymphocytes.
