## **Radioecology After Chernobyl Biogeochemical Pathways Of Artificial Radionuclides:**

*Radioecology After Chernobyl* Frederick Warner, Roy M. Harrison, 1993-06 The basic properties of isotopes of interest and their sources are described in the opening chapter the coverage is limited mainly to those whose release is due to human activities A series of case studies details the incidents which have been important for adding to knowledge of radionuclide behavior within atmospheric terrestrial aquatic and urban compartments of the environment and the pathways through which transfer occurs Major chapters give detailed reviews of current knowledge of environmental pathways of radioactivity and recommendations for future research This is followed by assessments of dosimetry and environmental effects

**Actinides and the Environment** P.A. Sterne, A. Gonis, A.A. Borovoi, 1998-02-28 The handling of actinides and actinide based materials provides significant technological challenges due to the toxicity and radioactivity associated with these materials These challenges are particularly apparent in the nuclear power industry Under normal operation a reactor can produce a significant amount of spent fuel requiring subsequent containment for geologic times and under accident conditions it can release lethal doses of radioactive material to the environment Inevitably radioactive material will enter the environment necessitating as complete an understanding as possible of its behavior An understanding of the interaction between actinides and the environment must be based on a knowledge of their basic physical and chemical properties To date although there is general agreement on the principles for waste disposal no facility has been built for the long term disposal of high level radioactive waste from either normal reactor operations or from accidental catastrophes This makes it most important for the scientific and technical community to develop the necessary cross disciplinary understanding that will help us implement safe and secure waste management accident remediation and accident prevention systems

**Radioecology and the Restoration of Radioactive-Contaminated Sites** F.F. Luykx, Martin J. Frissel, 2012-12-06 Most of the nuclear facilities built since the Second World War have ceased active operation and have been decommissioned Some of the sites are heavily contaminated with radioactive substances Correct and efficient action to mitigate the radiological consequences of such contamination will only be possible when the behaviour of radionuclides in the terrestrial environment is sufficiently well known Yet radioecologists often find it difficult to study the transfer of radioactivity in agricultural land and semi natural ecosystems because of the complexity and diversity of such environments The present book presents an analysis of all the factors that affect the behaviour of radionuclides as they move from their point of release through the environment and then enter the tissues of biota living in the ecosystems in particular plants and animals consumed by humans The course on which the book is based was held in a region that is heavily contaminated by radioactive discharges into the environment during nuclear weapons fabrication in the 1950s and 60s and due to a severe accidental release following the explosion of a rad waste tank in 1957 This allowed in situ training of the students The book's main emphasis is on specific radioecological problems in severely contaminated areas in the former Soviet Union the Southern Urals Trail the

rivers Techa Isert Tobol Irtis Ob and the 30 km zone around Chernobyl Systems examined include soils arable and pasture land forests lakes and rivers Special attention is paid to the effects of radiation on natural ecosystems trees soil dwelling organisms and aquatic organisms Synergistic effects are also considered Short medium and long term countermeasures are discussed

**A History of Radioecology** Patrick C. Kangas, 2022-12-26 This book presents a history of radioecology from World War II through to the critical years of the Cold War finishing with a discussion of recent developments and future implications for the field Drawing on a vast array of primary sources the book reviews synthesizes and discusses the implications of the ecological research supported by the Atomic Energy Commission AEC of the United States government from World War II to the early 1970s This was a critical period in the history of ecology characterized by a transition from the older largely descriptive studies of communities of plants and animals to the modern form of the science involving functional studies of energy flow and mineral cycling in ecosystems This transition was in large part due to the development of radioecology which was a by product of the Cold War and the need to understand and predict the consequences of a nuclear war that was planned but has never occurred The book draws on important case studies such as the Pacific Proving Grounds the Nevada Test Site El Verde in Puerto Rico the Brookhaven National Laboratory and recent events such as the nuclear disasters at Chernobyl and Fukushima By revisiting studies and archived information from the Cold War era this book offers lessons from the history of radioecology to provide background and perspective for understanding possible present day impacts from issues of radiation risks associated with nuclear power generation and waste disposal Post Cold War developments in radioecology will be also reviewed and contrasted with the AEC supported ecology research for further perspectives This book will be of great interest to students and scholars of radioecology environmental pollution environmental technology bioscience and environmental history

understanding      *Strontium Contamination in the Environment* Pankaj Pathak, Dharmendra K. Gupta, 2019-06-04 This book provides an authoritative review of the origin and extraction of strontium and its impact on the environment. It also presents the latest strontium decontamination and remediation strategies. Around the globe, nuclear power is being recognized as a major source of energy and is expected to play a crucial role in meeting the energy requirements of present-day society. However, the pros and cons have to be considered, and the safe disposal of large amounts of radionuclide wastes is becoming a matter of great concern. These wastes encompass contaminants such as heavy metals and toxic substances which may exist in solid, liquid, or gaseous forms or a combination of these, and as such their disposal requires particular attention. The book focuses on  $^{90}\text{Sr}$  which is a predominant isotope of strontium and considered an intermediate-level radioactive waste with a half-life of 28.8 years, average biological half-life of 18 years, and 546 KeV decay energy. Written by expert contributors, it addresses occurrence, detection, and extraction of strontium, the chemical and nuclear properties of strontium isotopes, the fate and migration of strontium in soil, its bioaccumulation, and its associated health impact, mechanistic toxicity response, as well as related regulation and remediation. It appeals to scholars, scientists, and environmental managers working with strontium contamination in the environment and its consequences.

**Airborne Radioactive Contamination in Inhabited Areas**, 2009-08-14 For many decades, investigations of the behaviour and implications of radioactive contamination in the environment have focused on agricultural areas and food production. This was due to the erroneous assumption that the consequences of credible contaminating incidents would be restricted to rural areas. However, due to the Chernobyl accident, more than 250,000 persons were removed from their homes, demonstrating a great need for knowledge and instruments that could be applied to minimise the manifold adverse consequences of contamination in inhabited areas. Also, today the world is facing a number of new threats, including radiological terrorism, which would be likely to take place in a city where most people would become directly affected. A recent report from the US Commission on the Prevention of Weapons of Mass Destruction, Proliferation, and Terrorism concludes that it is most likely that a large radiological or even nuclear terror attack on a major city somewhere in the world will occur before 2013. For the first time ever, the specific problems of airborne radioactive contamination in inhabited areas are treated in a holistically covering treatise pinpointing factorial interdependencies and describing instruments for mitigation. The state-of-the-art knowledge is here explained in *Airborne Radioactive Contamination in Inhabited Areas*, a leading scientists in the various disciplines of relevance. Unique holistic description of airborne radioactive contamination of inhabited areas and its consequences. State-of-the-art information on problems associated with both accidental and malicious contamination events, in particular dirty bombs. Detailed description of processes and parameters governing the severity of contaminating incidents. Written by key experts in the world.

**Marine Radioactivity**, 2004-09-17 This book on Marine Radioactivity sets out to cover most of the aspects of marine radioactivity which have been the focus of scientific study in recent decades The authors and their reviews divide into topic areas which have defined the field over its history They cover the suite of natural radioisotopes which have been present in the oceans since their formation and quantitatively dominate the inventory of radioactivity in the oceans Also addressed are the suite of artificial radionuclides introduced to the oceans as a consequence of the use of the atom for development of nuclear energy nuclear weapons and various applications of nuclear science The major source of these continues to derive from the global fallout of atmospheric tests of nuclear weapons in the 1950s and 1960s but also includes both planned and accidental releases of radioactivity from both civilian and military nuclear technology The other division of the major study direction depends on whether the objective is to use the radionuclides as powerful tools to study oceanic processes to describe and understand the ocean distribution of the various natural or artificial radionuclides or to assess the different radionuclides impact on and pathways to man or marine organisms The oceans cover 70% of the Earth's surface and thus

contains a corresponding large share of the Earth's radioactivity Marine Radioactivity covers topics of recent scientific study in this young field It examines both natural radioactivity radioactivity naturally present in oceans since their formation and artificial radioactivity radioactivity introduced by man and use of atomic and nuclear energy with regard to possible effects on the global environment

Equidosimetry F. Bréchnignac, G. Desmet, 2007-05-22 Considerable experience with radioecological and related ecological research on terrestrial and aquatic ecosystems has been achieved especially after the Chernobyl accident The combined effects of the radiation chemical and biological factors after a contamination of the environment and during its remediation have shown an interactive complexity that highlights the need for equidosimetrical evaluations of the influence of the various stressors and the need for their ecological normalization In radioecology and radiation protection methods of radiation dosimetry are key for dose assessment It is therefore highly desirable to develop a clear theoretical approach as well as a practical method of equidosimetry that would allow for an ecological normalization of the different stressors in unified uniform units especially for comparison purposes

**Ocular Radiation Risk Assessment in Populations Exposed to Environmental Radiation Contamination** A.K. Junk, Y. Kundiev, P. Vitte, B. V. Worgul, 1998-10-31 The global medical and scientific communities need to standardize methodologies and agree on minimum criteria to permit inter study comparisons This book develops such standards presenting a series of recommendations that represent the first codification of the manner in which studies should be executed

**Lake Issyk-Kul: Its Natural Environment** J. Klerx, Beishen Imanackunov, 2012-12-06 Lake Issyk Kul is a closed lake located in the Tien Shan mountain belt of the Republic of Kyrgyzstan It is the world's fifth deepest lake 668 m and the second largest high altitude lake in the world 1607 m above sea level The lake is affected by several environmental threats of both anthropogenic and natural origin decline of the lake level resulting in progressively increasing salinity incomplete vertical water exchange and risk of contamination by past and present industrial activity Although the lake has been intensively

studied the information is only available in unpublished reports or local scientific journals This book presents for the first time to an international audience the main physical chemical biological and geological characteristics of the lake the fruits of many years of observations complemented by recent results of international projects Case studies of similar problems in other parts of the world are presented together with ethical aspects of the environmental protection of the lake
