**MRI of the Central Nervous System** Koreaki Mori, 2012-12-06 In the past CT was the first choice among diagnostic measures for neurological diseases and MRI was considered to be a supplementary test However with the introduction of an ever increasing number of devices MRI is being used routinely and it is possible that eventually CT will become supplementary to MRI This guide to the practical use of MRI has been compiled bearing these considerations in mind Minimal working knowledge of the simple operations that does not require details about the technical production of television images is all that is required in order to obtain information from the views Thus even if a clinician is not thoroughly familiar with the theories of MRI he can use it as efficiently as he does the CT scan In this book the theoretical aspects of the principles of MRI are deliberately simplified and the text can be used solely as an atlas In the introduction useful general features of MRI interpretation are described and itemized and major diseases of the central nervous system are presented

Imaging of the Nervous System Paul Butler, 2012-12-06 Traditionally investigation of the nervous system has been primarily a clinical matter The great era of clinical assessment of patients with neurological disease in the first half of the century was determined by the necessity both to understand the phenomena of neurological disease in relation to structure and function and to localise lesions in order to facilitate the twin processes of diagnosis and management Over the years diverse techniques have been applied to clinical practice in order to improve the accuracy of diagnosis These have comprised extensions of clinical method for example clinical neuropsychology electro encephalography radiography of the skull and spine angiography and other contrast procedures including the now abandoned technique of air encephalography and myelography perhaps itself soon to be little used Isotope studies of the brain have possibly not realised their full potential in clinical neurology All these different investigations found an integrated place in clinical management enhancing the classical clinical database and its associated information derived from biochemical immunological and haematological studies The advent of computerised tomographic X ray scanning changed all this The quality of the images derived from CT scanning was so much superior to that obtainable by conventional X ray methods and the method was so non invasive in its conception that clinical practice in both medical and surgical neurology changed profoundly
