

LASER-INDUCED FLUORESCENCE ❖ 2651

James L. Kinsey

Department of Chemistry, Massachusetts Institute of Technology, Cambridge,
Massachusetts 02139

INTRODUCTION

The discovery of the laser and its subsequent development have profoundly affected the course of experimental research in practically every area of science. The laser's unique capacity to deliver large amounts of energy within extraordinarily small ranges of spectral width and directionality has made possible many kinds of measurement that would otherwise have been quite impossible. Wavelength tunability has proved to be an especially important advance that has not only revolutionized spectroscopy but has also brought the full grandeur of spectroscopic detail into many new areas.

Applications of lasers to various aspects of chemistry, physics, and biology have been the subjects of several recent review articles and monographs (1-7). This article concentrates on a single technique, laser-induced fluorescence (LIF), as a tool for the detection of minute amounts of atoms or molecules in specific quantum states. Applications of LIF to purely spectroscopic questions are not covered unless there is some direct bearing on the main subject matter. The literature survey for this review was completed in January 1977.

Although LIF is still in its infancy as a means for studying molecular collisions, interest in this technique is growing rapidly. Dye lasers with spectral widths in the range 1-10 MHz, which have become commercially available, offer an appealing wealth of resolvable detail. Unlike many other high-resolution methods, LIF even affords a favorable efficiency for detection. Fairbank, Hänsch & Schawlow (8) have recently demonstrated the ability for quantitative detection of sodium atoms by LIF at densities as low as 10^2 atoms cm^{-3} . Intensity estimates for more usual conditions show that LIF compares well in detection efficiency with mass spectrometric detection (9). Densities in the range of 10^4 cm^{-3} have successfully been detected (10). As it may be expected that technology will advance in the laser field more rapidly than in competing means of detection, the trend of such comparisons is likely to favor LIF in the future.
