Role Of Nonliving Organic Matter In The Earth's Carbon Cycle:

The Role of Nonliving Organic Matter in the Earth's Carbon Cycle Richard G. Zepp, Ch. Sonntag, 1995-07-11

Nonliving organic matter NLOM comprises the bulk of the organic carbon stored in the terrestrial biosphere and a major part of the organic carbon in the sea. Organic substances which include litter, marine detritus, dissolved organic matter, and soil organic matter have diverse effects on the Earth's biogeochemical processes and serve as a major reservoir of biospheric carbon which can be transformed to carbon dioxide, methane, and other greenhouse gases. Given this broad spectrum of effects, efforts to adapt to or perhaps benefit from global change require a better understanding and an ability to predict the role of NLOM in the global environment. The overall objective of this volume is to provide experimental and modeling strategies for the assessment of the sensitivity of the global carbon cycle to changes in nonliving organic pools in terrestrial and aquatic ecosystems. The discussions in this volume consider how best to characterize and quantify pools and fluxes of NLOM, the role of NLOM cycling on a global scale, human and climatic perturbations of interactions between NLOM and nutrients, and biological, chemical, and physical processes that control the production and degradation of NLOM, with an emphasis on processes that affect the persistence of NLOM in the environment. One of the most unique aspects of this volume is that it represents extensive exchanges between leading international scientists from both aquatic and terrestrial backgrounds. It will be of particular interest to organic geochemists, microbiologists, ecologists, soil scientists, agricultural scientists, marine chemists, limnologists, and modelers. Goal of this Dahlem Workshop: to devise experimental and modeling strategies for assessment of the sensitivity of the global carbon cycle to changes in nonliving organic pools. **Assessment**

Methods for Soil Carbon John M. Kimble, Ronald F. Follett, B.A. Stewart, 2000-12-28. Since carbon sequestration in soils reduces the amount of carbon available to the atmosphere, the Kyoto Protocol has heightened interest in soil carbon pools and their effect on carbon fluxes. **Assessment Methods for Soil Carbon** addresses many of the questions related to the measurement, monitoring, and verification of organic and inorganic carbon. **Remote Sensing of Coastal Aquatic**

Environments Richard L. Miller, Carlos E. Del Castillo, Brent A. McKee, 2007-03-06. Coastal waters are important ecological systems and vital assets for many nations. Coastal waters are also complex, dynamic environments where a vast array of coupled biological, chemical, geological, and physical processes occurs over multiple time and space scales. The optical environment of coastal waters is particularly complex. There is considerable interest in studying coastal waters to gain a better understanding of earth system processes for climatic change research or environmental factors for management decisions. Consequently, there is a need for robust, effective technologies and methods for studying these important, complex environments. Remote sensing from aircraft and space-based platforms offers unique, large-scale synoptic data to address the intricate nature of coastal waters. However, many researchers wishing to apply remote sensing to a dynamic coastal environment are faced with the challenge of learning a technology laden with new and often confusing terminology, data, and

methods of processing and analysis To gain an adequate understanding of remote sensing generally involves scouring countless technical manuals reports and scientific papers Hence the major goal of writing this work was to produce a comprehensive resource for those involved in various studies of coastal aquatic environments With its primary focus on optical remote sensing using passive instruments the editors have indeed succeeded in creating a book the scientific community has been waiting for

Runaway Climate Steven Earle, 2024-04-30 With tipping points and extreme global warming looming the key to understanding our climate future lies in our distant past If you care at all about our future you must read *Runaway Climate* Richard Heinberg Senior Fellow Post Carbon Institute With rising emissions we are on track to cause rapid global warming with devastating consequences But how bad could climate change get and what might it do to planet Earth and humanity Fifty six million years ago our planet experienced a period of intense warming known as the Paleocene Eocene Thermal Maximum PETM resulting in a rapid global temperature increase of about 7 C Triggered by natural geological processes over millennia and magnified by strong climate feedback loops the PETM lasted for about 180 000 years and drastically altered life on Earth Yet in only a few short decades we've pumped similar amounts of greenhouse gases into the atmosphere making the PETM an unsettlingly apt analogy for our current predicament This deeply cautionary tale explores The runaway feedbacks that pushed the PETM's climate past the tipping point Subsequent cascades of environmental devastation from plant and animal migrations to ocean acidification extreme weather and mass extinctions A sobering vision of life on hothouse Earth a hostile world of desertification sea level rise climate refugees and agricultural collapse The urgent need for decisive individual and collective actions to slash carbon emissions stabilize the climate and undertake a rapid transition to a cleaner and healthier future Scientifically rigorous yet accessible to a wide audience *Runaway Climate* is essential reading for every one committed to understanding and taking action on the climate emergency

The Potential of U.S. Forest Soils to Sequester Carbon and Mitigate the Greenhouse Effect John M. Kimble, Rattan Lal, Richard Birdsey, Linda S. Heath, 2002-09-25 Much attention has been given to above ground biomass and its potential as a carbon sink but in a mature forest ecosystem 40 to 60 percent of the stored carbon is below ground As increasing numbers of forests are managed in a wide diversity of climates and soils the importance of forest soils as a potential carbon sink grows The Potential

Aquatic Humic Substances Dag Hessen, Lars J. Tranvik, 2013-03-09 Humic substances occur in all kinds of aquatic systems but are particularly important in northern coniferous areas They strongly modify the aquatic ecosystems and also constitute a major problem in the drinking water supply This volume covers all aspects of aquatic humic substances from their origin and chemical properties their effects on light and nutrient regimes and biogeochemical cycling to their role regarding organisms productivity and food web organization from bacteria to fish Special emphasis is paid to carbon cycling and food web organization in humic lakes but aspects of marine carbon cycling related to humus are treated as well

The Effects of UV Radiation in the Marine

Environment Stephen De Mora, Serge Demers, Maria Vernet, 2000-03-09 This book first published in 2000 provides a comprehensive review of UV radiation effects in the marine environment. A multidisciplinary approach is adopted to discuss all aspects from a physical, chemical, and biological perspective. The book begins by describing the attenuation of UV radiation in the atmosphere and sea water, outlining the photochemical reactions involved and highlighting the role that such chemistry can play in influencing the biogeochemical cycling of various elements. The deleterious consequences of such radiation on organisms and strategies adopted to mitigate these harmful repercussions are discussed. The organisms considered range from virus and bacteria through phytoplankton and zooplankton to fish and mammals. The book is aimed at researchers and graduate students in photobiology, photochemistry, and environmental science. It will also be useful as a supplementary text for courses in oceanography, climatology, and ecology. *Biogeochemistry* W.H. Schlesinger, Emily S. Bernhardt, 2013-01-14 For the past 4 billion years the chemistry of the Earth's surface where all life exists has changed remarkably. Historically, these changes have occurred slowly enough to allow life to adapt and evolve. In more recent times, the chemistry of the Earth is being altered at a staggering rate fueled by industrialization and an ever-growing human population. Human activities, from the rapid consumption of resources to the destruction of the rainforests and the expansion of smog-covered cities, are all leading to rapid changes in the basic chemistry of the Earth. The Third Edition of *Biogeochemistry* considers the effects of life on the Earth's chemistry on a global level. This expansive text employs current technology to help students extrapolate small-scale examples to the global level and also discusses the instrumentation being used by NASA and its role in studies of global change. With the Earth's changing chemistry as the focus, this text pulls together the many disparate fields that are encompassed by the broad reach of biogeochemistry. With extensive cross-referencing of chapters, figures, and tables, and an interdisciplinary coverage of the topic at hand, this text will provide an excellent framework for courses examining global change and environmental chemistry and will also be a useful self-study guide. Emphasizes the effects of life on the basic chemistry of the atmosphere, the soils, and seawaters of the Earth. Calculates and compares the effects of industrial emissions, land clearing, agriculture, and rising population on Earth's chemistry. Synthesizes the global cycles of carbon, nitrogen, phosphorous, and sulfur and suggests the best current budgets for atmospheric gases such as ammonia, nitrous oxide, dimethyl sulfide, and carbonyl sulfide. Includes an extensive review and up-to-date synthesis of the current literature on the Earth's biogeochemistry. *Chemical Processes in Marine Environments* Antonio Gianguzza, Ezio Pelizzetti, Silvio Sammartano, 2013-06-29 This book discusses recent developments in the study of chemical processes and equilibria in the marine environment and in the air-water and water-sediment interfaces. The chemical cycle of carbon, as well as the effect of organic substances on the speciation and distribution of inorganic and organometallic substances, are extensively discussed. Much of the recent progress in the area is the direct result of advanced analytical technologies and chemometric applications, which are highlighted in the book. **The Marine Ecosystems of**

Sabah Teruaki Yoshida, B. Mabel Manjaji-Matsumoto, 2022-01-31 This book successfully bridges the gap between academic text to an informal study of the significance of life in the oceans around us providing an ideal introduction to the subject for conservationists hobbyist policymakers and students The book sheds light on the pressing issues and focuses on the areas of research that Sabah is experiencing today as marine scientists from the Borneo Marine Research Institute continue to advance in understanding the marine environment of Sabah in line with the priorities of the state and the country Explore a wide range of topics from single cell algae to large marine vertebrates from hydrodynamics and water quality to effects of marine plastic pollution from the biological to the physical and chemical aspects of the marine environment in Sabah After going through each chapter it gives the saying Sabah is blessed with natural wonders a deeper reflection of what the ocean means to the environment and people of the state **Highlights** Environmental Research Laboratory (Athens, Ga.), 1993
