## ABSTRACT

We investigate the Cauchy problem for the focusing inhomogeneous nonlinear Schrödinger equation  $i\partial_t u + \Delta u = -|x|^b |u|^{p-1} u$  in the radial Sobolev space  $H^1_b(\mathbb{R}^N)$ , where  $b > 0$  and  $p > 1$ . We show the global existence and energy scattering in the intercritical regime, i.e.,  $p > \frac{N+1+2b}{N-2}$  and  $p < \frac{N+1+2b}{N-2}$  if  $N \geq 3$ . We also obtain blowing-up solutions for the mass-critical and mass-supercritical nonlinearities. The main difficulty, coming from the spatial growing nonlinearity, is overcome by refined Gagliardo–Nirenberg-type inequalities. Our proofs are based on improved Gagliardo–Nirenberg inequalities, the Morawetz–Sobolev approach of Dodson and Murphy [Proc. Am. Math. Soc. 145(11), 4859–4867 (2017)], radial Sobolev embeddings, and localized virial estimates.

## 1. INTRODUCTION

In this paper, we consider the Cauchy problem for the following focusing inhomogeneous nonlinear Schrödinger equation:

$$i\partial_t u + \Delta u = -|x|^b |u|^{p-1} u, \quad (t, x) \in \mathbb{R}_+ \times \mathbb{R}^N, \quad (1.1)$$

where  $b > 0$  and  $p > 1$ . Equation (1.1) is a special case of a more general inhomogeneous nonlinear Schrödinger equation given by

$$i\partial_t u + \Delta u = K(x) |u|^{p-1} u, \quad (1.2)$$

which arises in various physical contexts such as the propagation of a laser beam and plasma waves. Here,  $u$  is the electric field in laser optics and  $K$  is proportional to the electric density.<sup>1,2</sup> For  $p = 3$ , Eq. (1.1) can be viewed as a model of dilute Bose–Einstein condensate when the two-body interactions of the condensate are considered.

The Cauchy problem for (1.2) was first investigated by Merle<sup>3</sup> who proves the existence of blow-up solutions in the mass-critical regime and under some assumptions on  $K$  including in particular  $k_1 \leq K(x) \leq k_2$  with  $k_1, k_2$  being positive constants. Later on, the stability of standing waves was studied in Refs. 7 and 8 for  $K(x) = K(|x|)$  with  $K \in C^2(\mathbb{R}^N) \cap L^\infty(\mathbb{R}^N)$ ,  $\epsilon > 0$  small, and  $p \geq 1 + \frac{2}{N}$ . Recently, the Cauchy problem

**Navier-Stokes Predictions of Dynamic Stability Derivatives** James DeSpirito, Sidra I. Sifton, Paul Weinacht, 2008 The prediction of the dynamic stability derivatives roll damping Magnus and pitch damping moments were evaluated for three spin stabilized projectiles using steady state computational fluid dynamic CFD calculations Roll damping CFD predictions were found to be very good across the Mach number range investigated Magnus moment predictions were very good in the supersonic flight regime however the accuracy varied in the subsonic and transonic flight regime The best Magnus moment prediction in the subsonic flight regime was for the square base projectile that did not exhibit highly nonlinear Magnus moments A primary contribution of this report is the demonstration that the pitch damping moment can be adequately predicted via steady state methods rather than resorting to unsteady techniques The predicted pitch damping moment compared very well to experimental data for the three projectiles investigated For one configuration the pitch damping moment was predicted by several CFD codes two different steady state methods and a time accurate planar pitching motion method All methods compared very well to each other and to the experimental data

pronounced theoretical nature Besides the atmosphere however our planet has another liquid envelope the hydrosphere world s ocean which also concerns ocean dynamics and therefore it is necessary to define from a unified standpoint the subject and aims of the disciplines dealing with the dynamics of the processes which take place in both fluid spheres Such a unified standpoint offers the so called geophysical fluid dynamics During the past few years this description is encountered quite often in scientific literature concerning the Earth as a planet Obviously a scientific branch or a science is created whose subject is our planet and the investigation methods are borrowed from classical fluid dynamics and applied mathematics including the most recent numerical methods As can be seen from its very suitable name it is the dynamics of quite definite geophysical fluids atmosphere ocean and even the liquid inside of the Earth and not of some abstract often perfect fluids as in classical hydrodynamics
