Bell, Keith A. Berrington, Derrick S.F. Crothers, Alan Hibbert, Kenneth T. Taylor, 2006-04-18 Professor Philip G Burke CBE FRS formally retired on 30 September 1998 To recognise this occasion some of his colleagues friends and former students decided to hold a conference in his honour and to present this volume as a dedication to his enormous contribution to the theoretical atomic physics community The conference and this volume of the invited talks reflect very closely those areas

with which he has mostly been associated and his influence internationally on the development of atomic physics coupled with a parallel growth in supercomputing. Phil's wide range of interests include electron-atom-molecule collisions, scattering of photons and electrons by molecules adsorbed on surfaces, collisions involving oriented and chiral molecules, and the development of non-perturbative methods for studying multiphoton processes. His development of the theory associated with such processes has enabled important advances to be made in our understanding of the associated physics; the interpretation of experimental data has been invaluable in application to fusion processes and the study of astrophysical plasmas observed by both ground and space-based telescopes. We therefore offer this volume as our token of affection and respect to Philip G. Burke with the hope that it may also fill a gap in the literature in these important fields.

Case Studies in Atomic Collision Physics E. W. McDaniel, M. R. C. McDowell, 2013-09-11. *Case Studies in Atomic Collision Physics II* focuses on studies on the role of atomic collision processes in astrophysical plasmas including ionic recombination, electron transport and position scattering. The book first discusses three-body recombination of positive and negative ions as well as introduction to ionic recombination, calculation of the recombination coefficient, ions recombining in their parent gas and three-body recombination at moderate and high gas densities. The manuscript also takes a look at precision measurements of electron transport coefficients and differential cross sections in electron impact ionization. The publication examines the interpretation of spectral intensities from laboratory and astrophysical plasmas, atomic processes in astrophysical plasmas and polarized orbital approximations. Discussions focus on collision rate experiments, line spectrum collisional excitation and ionization, polarized target wave function and application to positron scattering and annihilation. The text also ponders on cross sections and electron affinities and the role of metastable particles in collision processes. The selection is a valuable source of data for physicists and readers interested in atomic collision.

Search for Supersymmetry in pp Collisions at $\sqrt{s} = 8$ TeV with a Photon, Lepton, and Missing Transverse Energy Yutaro Iiyama, 2017-06-14. This Ph.D. thesis is a search for physics beyond the standard model (SM) of particle physics which successfully describes the interactions and properties of all known elementary particles. However, no particle exists in the SM that can account for the dark matter which makes up about one quarter of the energy-mass content of the universe. Understanding the nature of dark matter is one goal of the CERN Large Hadron Collider (LHC). The extension of the SM with supersymmetry (SUSY) is considered a promising possibility to explain dark matter. The nominated thesis describes a search for SUSY using data collected by the CMS experiment at the LHC. It utilizes a final state consisting of a photon, a lepton, and a large momentum imbalance, probing a class of SUSY models that has not yet been studied extensively. The thesis stands out not only due to its content that is explained with clarity but also because the author performed more or less all aspects of the thesis analysis by himself, from data skimming to limit calculations, which is extremely rare, especially nowadays in the large LHC collaborations.

Bibliography of Low Energy Electron Collision Cross Section Data Lee Joseph Kieffer, 1967. A bibliography of low

energy electron collision cross section data is presented Only references which report original measurements or calculations of electron collision cross sections are included The cross section data for each process are listed by atomic species in order of their atomic number The data for molecules are listed in arbitrary order Author

Dynamics of Molecular Collisions W. Miller, 2012-12-06 Activity in any theoretical area is usually stimulated by new experimental techniques and the resulting opportunity of measuring phenomena that were previously inaccessible Such has been the case in the area under consideration here beginning about fifteen years ago when the possibility of studying chemical reactions in crossed molecular beams captured the imagination of physical chemists for one could imagine investigating chemical kinetics at the same level of molecular detail that had previously been possible only in spectroscopic investigations of molecular structure This created an interest among chemists in scattering theory the molecular level description of a bimolecular collision process Many other new and also powerful experimental techniques have evolved to supplement the molecular beam method and the resulting wealth of new information about chemical dynamics has generated the present intense activity in molecular collision theory During the early years when chemists were first becoming acquainted with scattering theory it was mainly a matter of reading the physics literature because scattering experiments have long been the staple of that field It was natural to apply the approximations and models that had been developed for nuclear and elementary particle physics and although some of them were useful in describing molecular collision phenomena many were not The most relevant treatise then available to students was Mott and Massey's classic *The Theory of Atomic Collisions* but as the title implies it dealt only sparingly with the special features that arise when at least one of the collision partners is a molecule

Optics and Spectroscopy, 1986 Atomic Processes in Electron-Ion and Ion-Ion Collisions F. Brouillard, 2013-03-09 Four years after a first meeting in BADDECK Canada on the Physics of Ion-Ion and Electron-Ion collisions a second Nato Advanced Study Institute in HAN Lesse Belgium reexamined the subject which had become almost a new one in consideration of the many important developments that had occurred in the mean time The developments have been particularly impressive in two areas the dielectronic recombination of electrons with ions and the collisional processes of multiply charged ions For dielectronic recombination a major event was the obtainment in 1983 of the first experimental data This provided at last a non speculative basis for the study of that intricate and subtle process and strongly stimulated the theoretical activities Multiply charged ions on the other hand have become popular thanks to the development of powerful ion sources This circumstance together with a pressing demand from thermonuclear research for ionisation and charge exchange cross sections has triggered systematic experimental investigations and new theoretical studies which have contributed to considerably enlarge over the last five years our understanding of the collisional processes of multiply charged ions Dielectronic recombination and multiply charged ions were therefore central points in the programme of the ASI in HAN Lesse and are given a corresponding emphasis in the present book

The Role of Rydberg States in Spectroscopy and Photochemistry C.

Sándorfy,2006-04-11 The aim of this volume is to offer a balanced overview of molecular Rydberg spectroscopy as it has developed over recent decades Recent evolution has split Rydberg spectroscopy into two apparently distinct fields the one concerns the low n 3 5 Rydberg states the other the very high typically EMn EM 150 Rydberg states The former is aimed at spectral levels where Rydberg valence shell and intermediate type states interact with a variety of photochemical consequences The latter considers states extremely close to the ionization limit from where ionization is possible with a very slight amount of additional energy Recently developed techniques make it possible to produce ions in well defined electronic vibrational and rotational states including states resulting from spin orbit or Jahn Teller splitting It is then possible to study the structure and reactions of such state selected ions as well as those of the corresponding neutral molecules These techniques amount to badly needed high resolution photoelectron spectroscopy

Dynamics of Ion-Molecule Complexes William L Hase,2016-07-29 Advances in Classical Trajectory Methods Volume 2 Dynamics of Ion Molecule Complexes is a seven chapter text that covers the considerable advances in the experimental and theoretical aspects of ion molecular complexes with particular emphasis on the dynamics and kinetics of their formation and ensuing unimolecular dissociation This text also considers the development and testing of theoretical models for these formation and decomposition processes The opening chapters discuss photoelectron photoion coincidence ion cyclotron resonance and crossed molecular beam studies of metastable ion molecule complexes formed in ion molecule collisions These experimental studies involve comparisons with the predictions of statistical models such as the Rice Ramsperger Kassel Marcus and phase space theories and comparisons with the reaction dynamics predicted by classical trajectory calculations The succeeding chapter describes the double well model for ion molecular reactions taking place on a potential energy surface with a central barrier that separates two potential energy minima These topics are followed by reviews of the quantum chemical calculation and reaction path Hamiltonian analysis of SN2 reactions the transition state theory for ion dipole and ion quadrupole capture and

the capture and dynamical models for ion molecule association to form a complex The remaining chapters consider the temperature dependence of ion molecule reactions which proceed on a surface with many potential energy minima specifically the ability to establish asymptotic limits for the reaction efficiency dependent upon the number of potential minima and the above relative probabilities This book is of great value to experimental and theoretical chemists and physicists
