Magnesium In Health And Disease:

Magnesium in Health and Disease M. Cantin, M.S. Seelig, 1980-10-31 **Magnesium in Human Health and Disease** Ronald Ross Watson, Victor R Preedy, Ed., Sherma Zibadi, 2016-05-01 This book provides current research on the potential benefits or lack thereof for normal and high supplementation with magnesium and provides new results that suggests how levels above the recommended intakes can promote health and treat various diseases **Magnesium in Human Health and Disease** Ronald Ross Watson, Victor R. Preedy, Sherma Zibadi, 2012-09-14 Magnesium is an essential mineral which is required for growth and survival of humans Since magnesium is a mineral and not synthesizable it must be obtained through dietary foods and or supplements Magnesium in Human Health and Disease reviews the benefits of magnesium supplementation to reach recommended intakes as well as provides new research that suggests how reaching levels above the recommended intakes can promote health and treat various diseases Magnesium deficiency can cause low serum potassium and calcium levels retention of sodium and low circulating levels of regulatory hormones These changes in nutrients cause neurological and muscular symptoms such as tremor and muscle spasms Further magnesium deficiency causes loss of appetite nausea vomiting personality changes and death from heart failure Causes of magnesium deficiency include alcohol abuse poorly controlled diabetes excessive or chronic vomiting and or diarrhea Thus the effects of inadequate and deficient intakes or levels of magnesium is critical to health and are reviewed by the expert clinicians in this book Magnesium in Human Health and Disease provides the most current research to support the potential benefits or lack thereof for normal and high supplementation with magnesium Animal model research and early human trials are reviewed to document other disease states such as hypertension cholesterol level type 2 diabetes and cardiovascular disease that would benefit from increased magnesium *Magnesium Deficiency in the Pathogenesis of Disease* Mildred S. Seelig, 2012-12-06 There is a large and rapidly growing body of literature on the importance of magnesium in biochemical and physiological processes There is also much evidence that magnesium deficiency alone and in combination with agents that interfere with its utilization is associated with functional and structural abnormalities of membranes cells organs and systems The manifestations of the changes caused by magnesium deficiency depend upon its extent and duration and on variable factors Among the conditions that increase the risk of magnesium deficiency are 1 metabolic factors that affect the absorption distribution and excretion of this mineral 2 disease and therapy 3 physiologic states that increase requirements for nutrients and 4 nutritional imbalances Excesses of nutrients that interfere with the absorption or increase the excretion of magnesium such as fat phosphate sugar and vitamin D can contribute to long lasting relative magnesium deficiency All have been implicated in several of the diseases considered in this book Whether their influence on the need for magnesium is a common denominator remains to be investigated further Nutrition and Heart Disease H.K. Naito, 2012-12-06 Entering the 1980 s coronary heart disease CHD still remains the major cause of death in the United States and ranks second in the world in

terms of CHD mortality rates However CHD mortality and morbidity rates in the United States have declined significantly since the 1950 s There are many reasons for this positive and encouraging change one of which is the increasing awareness of the importance of the role of nutrition in health and disease Diet has been identified as an important factor contributing to hyperlipidemia in individuals and populations Dietary modification has become a routine means of treating patients with lipid disorders The relationship between diet and chronic disease is however far from simple and at the present time needs further intensive research Many significant advances have recently taken place in our understanding of the effect of different nutritional components on blood lipids and lipoproteins and on the initiation progression and regression of atherosclerotic processes This symposium The 19th annual meeting of the American College of Nutrition Cardiovascular Disease and Nutrition held at Bloomington Minn on June 1 2 1978 addressed many of the important questions concerning the association of diet and CRD We have not restricted the topic to hyperlipidemia and CHD per se but have considered cardiovascular disease in general This monograph should be of interest to the dietitian nutritionist pediatric clinician cardiologist physicians in general and researchers in the field of cardiovascular disease Herbert K Naito Ph D
