HARI, 2012-11-15 The more the science has advanced the further away have we moved from nature. Thanks to our artificial existence even to quench a natural urge like thirst we imbibe synthetic substances such as colas and caffeine loaded drinks. Having starved our body of nature's most precious liquid water we are beset with multiple ailments like headaches arthritis asthma urinary problems general debility blood pressure and the like. Very often missing the root cause of the problem we rush to doctors only to have antibiotics pumped into us that offer short term relief while turning into long term nightmares. This book shows how drinking just 12 to 14 glasses of water per day for the average person cures many ailments including chronic ones. v publishers *The Invisible Force* Fred Rinker, 1997 **A Cancer Battle Plan Sourcebook** David J. Frähm, 2000-03-06 Since its publication A Cancer Battle Plan has sold more than 200 000 copies and continues to be a source of inspiration and information for people struggling with cancer and other degenerative diseases. Modern approaches to the synthesis of algorithmic support for a strapdown inertial attitude system are considered. The general characteristics of navigation systems and the composition of their inertial measurement unit are given. The methods of initial alignment of the system on a stationary base are described. Particular attention is paid to the attitude kinematic parameters of the body frame and methods of their numerical integration. Picard's methods for integrating the Bortz and Poisson kinematic equations are shown. An algorithm for a strapdown inertial attitude system based on using real signals of high precision laser gyroscopes is proposed. System simulation was carried out using the proposed algorithmic methods. The relevance of the control system created for the processing device parts in the conditions of automated manufacturing is substantiated. Theoretical studies are presented and the relation between electrical signals the level of tool wear and the main reasons for generating electrical

signals are identified A mathematical model of cutting tool wear control was developed based on measuring the variable component of cutting electromotive force A control system for processing device parts on computer numerical control machines in automated production conditions has been developed It allows for recording critical wear and breakage of the cutting tool performing its dimensional adjustment directly on the device and carrying out its industrial approval in flexible production systems
