

Electroencephalography (EEG) is the gold standard for seizure detection.

However, despite high temporal resolution, EEG has poor spatial resolution.

Resting state functional magnetic resonance imaging (rs-fMRI) may help map seizure topography, by detecting synchronization of blood-oxygen-level-dependent (BOLD) signal across the brain.

A patient with ongoing right hemispheric focal seizures after a cardiac arrest underwent rs-fMRI.

We used unbiased processing methods to detect rhythmic oscillations of BOLD signal.

Rhythmic BOLD signal, also detected in the contralateral cerebellum, may more precisely map seizure topography.
