Magnetic Resonance Techniques In Clinical Trials In Multiple Sclerosis:

Magnetic Resonance Techniques in Clinical Trials in Multiple Sclerosis M. Filippi, R.I. Grossmann, G. Comi, 2012-12-06 We have entered an exciting period in the study of multiple sclerosis and its treatment Central to this progress has been the introduction of magnetic resonance techniques When Young and his colleagues published the first images of the brain in multiple sclerosis at the end of 1981 it was at once obvious that magnetic resonance imaging would play a major role in diagnosis Intuitively one felt that it would also have a role in increasing our understanding of the pathogenesis of the disease and in monitoring treatment And so it has proved Important problems however remain perhaps the most important of which at present is the weak predictive power of standard magnetic resonance imaging methods in determining the possibility of progression of impairment and disability Recently there have been advances which promise to overcome some of these problems but decisions about what approach to adopt in selecting patients for clinical trials and which techniques to use in monitoring treatment during their course are still difficult In this book Dr Filippi and his colleagues have assembled an outstanding group of contributors whose work is central to the progress that is being made The coverage of the issues involved in the use of magnetic resonance techniques in assessing therapeutic effect is comprehensive and though the field is changing rapidly the principles and much of the detail in the book are likely to have lasting value

Treatment and Management of Multiple Sclerosis Frank H. Columbus, 2005 Multiple sclerosis MS is a life long chronic disease diagnosed primarily in young adults During an MS attack inflammation occurs in areas of the white matter of the central nervous system nerve fibers that are the site of MS lesions in random patches called plaques This process is followed by destruction of myelin which insulates nerve cell fibers in the brain and spinal cord Myelin facilitates the smooth high speed transmission of electrochemical messages between the brain the spinal cord and the rest of the body The initial symptom of MS is often blurred or double vision red green color distortion or even blindness in one eye Most MS patients experience muscle weakness in their extremities and difficulty with coordination and balance Most people with MS also exhibit paresthesias transitory abnormal sensory feeling such as numbness or pins and needles Some may experience pain or loss of feeling About half of people with MS experience cognitive impairments such as difficulties with concentration attention memory and judgment Presents leading research from around the globe
