Fusion Energy Update ,1986   Stellarator and Heliotron Devices Masahiro Wakatani,1998 This monograph describes plasma physics for magnetic confinement of high temperature plasmas in nonaxisymmetric toroidal magnetic fields or stellarators The techniques are aimed at controlling nuclear fusion for continuous energy production While the focus is on the nonaxisymmetric toroidal field or heliotron developed at Kyoto University the physics applies equally to other stellarators and axisymmetric tokamaks The author covers all aspects of magnetic confinement formation of magnetic surfaces magnetohydrodynamic equilibrium and stability single charged particle confinement neoclassical transport and plasma heating He also reviews recent experiments and the prospects for the next generation of devices   **An Introduction to Stellarators** Lise-Marie Imbert-Gérard,Elizabeth J. Paul,Adelle M. Wright,2024-12-10 This self contained book is the first to provide readers with an introduction to the mathematical foundations of stellarator design and modeling It covers the fundamental theoretical building blocks of modeling magnetic fields some of the associated challenges and the main concepts behind optimization for the design of stellarators The book is divided into two parts with Part I providing a general introduction to the stellarator concept and Part II describing mathematical models and numerical methods commonly used in stellarator design The authors derive present and discuss relevant models using equations and figures to demonstrate the main ideas They carefully select language that is close to the plasma physics literature while providing enough details to be accessible to a reader without previous background in this field An Introduction to Stellarators From Magnetic Fields to Symmetries and Optimization is intended for mathematicians physicists and engineers interested in learning about stellarators Readers are expected to have a basic knowledge of classical physics partial differential equations and variational calculus but prior knowledge of plasma physics is

  Systems Approaches to Nuclear Fusion Reactors Frederick B. Marcus,2023-01-01 This book offers an overall review applying systems engineering and architecture approaches of the design optimization operation and results of leading fusion experiments These approaches provide a unified means of evaluating reactor design Methodologies are developed for more coherent construction or evaluation of fusion devices associated experiments and operating procedures The main focus is on tokamaks with almost all machines and their important results being integrated into a systems design space Case studies focus on DIII D TCV JET WEST the fusion reactor prototype ITER and the EU DEMO concept Stellarator Mirror and Laser inertial confinement experiments are similarly analysed including reactor implications of breakeven at NIF The book examines the engineering and physics design and optimization process for each machine analysing their performance and major results achieved thus establishing a basis for the improvement of future machines The reader will gain a broad historical and up to date perspective of the status of nuclear fusion research from both an engineering and physics point of view Explanations are given of the computational tools needed to design and operate successful experiments and reactor relevant machines This book is aimed at both graduate students and practitioners of nuclear fusion science and engineering as well as those specializing in other fields demanding large and integrated experimental equipment Systems engineers will obtain valuable insights into fusion applications References are given to associated complex mathematical derivations which are beyond the scope of this book The general reader interested in nuclear fusion will find here an accessible summary of the current state of nuclear fusion **Computational Methods in Optimal Control** William H. Hager,2025-02-13 Using material from many different sources in a systematic and unified way this self contained book provides both rigorous mathematical theory and practical numerical insights while developing a framework for determining the convergence rate of discrete approximations to optimal control problems Elements of the framework include the reference point the truncation error and a stability theory for the linearized first order optimality conditions Within this framework the discretized control problem has a stationary point whose distance to the reference point is bounded in terms of the truncation error The theory applies to a broad range of discretizations and provides completely new insights into the convergence theory for discrete approximations in optimal control including the relationship between orthogonal collocation and Runge Kutta methods Throughout the book derivatives associated with the discretized control problem are expressed in terms of a back propagated costate In particular the objective derivative of a bang bang or singular control problem with respect to a switch point of the control are obtained which leads to the efficient solution of a class of nonsmooth control problems using a gradient based optimizer Computational Methods in Optimal Control Theory and Practice is intended for numerical analysts and
