produce mineralized tissues such as bone teeth diatoms and shells Biomineralization is the sophisticated process of production of these inorganic minerals by living organisms Construction of organic inorganic hybrid materials with controlled mineralization analogous to those produced by nature has recently received much attention because it can aid in understanding the mechanisms of the biomineralization process and development of biomimetic materials processing The biomineralization processes use aqueous solutions at temperatures below 100 C and no toxic intermediates are produced in these systems From a serious global environmental problem point of view the development of processes inspired by biomineralization would offer valuable insights into material science and engineering to reduce energy consumption and environmental impact One of the most challenging scientific problems is to gain greater insight into the molecular interactions occurring at the interface between the inorganic mineral and the macromolecular organic matrix Model systems are often regarded as a straight forward experimental approach toward biomimetic crystallization Hierarchical architectures consisting of small building blocks of inorganic crystals are often found in biominerals Studies of nanocrystal self organization in solution systems would also be helpful for understanding biomineralization In these volumes we focus on construction of organic inorganic hybrid materials with controlled mineralization inspired by natural biomineralization In the first volume thereafter will find contributions providing a basic scope of the mineralization process in aqueous solution

**The Chemistry of Biology** Armin Börner,Juliana Zeidler,2023-02-14 Living organisms are distinguished by their chemical basis Thus knowledge of the properties of the elements and the interactions of the resulting compounds is a prerequisite for understanding biology Chemistry answers the questions of why among the more than 100 elements of the periodic table PSE carbon and not silicon is the dominant element in biology and why precious metals such as gold and silver do not play a role The PSE provides information about why phosphoric acid and not sulfuric acid acts as a bridge in polynucleic acids and why DNA had to evolve from RNA At the same time only chemistry makes clear why D glucose is so central in building biopolymers such as cellulose and glycogen and why the citrate cycle is logically self contained and without alternative Biochemistry is also a synthesis chemistry that differs from man made synthesis chemistry only in terms of the framework conditions Individuals are selected from the multitude of elements of the PSE and the almost infinite number of chemical compounds The selection is based on the environmental conditions on Earth such as moderate temperatures preferably atmospheric pressure solvent water and as primary reaction partner oxygen The hypothesis is developed that the guiding principle of modern biology the theory of evolution has its roots in the underlying chemistry This turns Darwinism from its biological head to its chemical feet For example the effect of phenols as radical scavengers is a priori chemical before biological phenomena could evolve from it as differences in distinction in colored flowering plants The book develops a completely new chemistry centered view of animate nature and challenges a changed biologically oriented didactics of chemistry in schools and universities
