Abstract Concrete structure is one of the common construction materials in the world. The reliability in terms of performance, durability and cost effective are the major advantages in utilising concrete as construction material. However, due to time and workmanship, concrete is prone to deterioration. In this study, three main beam size of 400 mm x 1200 mm in size is evaluated in terms of structure integrity using Non-Destructive Test. Ultrasonic Pulse Velocity (UPV) is adapted to determine the concrete quality. For durability aspects, the utilisation of X Ray Fluorescence (XRF) with rapid carbonation kit is adapted. From this finding, one of the beams inspected is detected with poor quality. This is supported by visual for crack detection and voids in all beam. Elementary for concrete quality for all beams is confirmed using XRF and supported with carbonation kit. In conclusion, the outcome from NDT proves to determine any structure failure and factors contribute to the problem. Furthermore, the solutions to the problem can be identified.

1. Introduction

Nondestructive test is a method of testing existing concrete structures to assess the strength and durability of concrete structure. In the nondestructive method of testing, without loading the specimen to failure (i.e., without destructing the concrete) we can measure the strength of concrete [1, 2]. Nowadays this method has become a part of quality control process. This method of testing also helps us to investigate crack depth, micro cracks and deterioration of concrete. Nondestructive testing of concrete is a very simple method of testing but it requires skilled and experienced persons having some special knowledge to interpret and analyse test results. Various non-destructive methods of testing concrete have been developed to analyse properties of hardened concrete such as surface hardness test, rebound hammer test, penetration and pull-out techniques, dynamic or vibration test, x ray analysis and magnetic electrical method [1, 3].

Apart from that, Non-destructive testing (NDT) methods are techniques used to obtain information about the properties or internal condition of an object without damaging the object. Non-destructive testing is a descriptive term used to evaluate the materials and components in a way that protects materials from being destructive and can be used again for further investigation. In addition, NDT is a method of controlling the quality of
