Nonequilibrium Processes in the Planetary and Cometary Atmospheres : Theory and Applications ,1997

Nonequilibrium Processes in the Planetary and Cometary Atmospheres: Theory and Applications Mikhail Ya. Marov,V. Shematovich,D. Bisikalo,Jean-Claude Gérard,2001-11-30 This book reviews the approach to the kinetic simulation of nonequilibrium processes in the planetary atmospheres which the authors developed and dealt with since the 1970s The results of this study which are focused on the nonequilibrium collisional processes in the atmospheres of planets and comets are thoroughly reviewed and discussed Many specific problems of atmospheric modeling involving numerical evaluation of aeronomic processes are addressed and compared with the available experimental data The kinetic approach proved to be especially effective to model the interaction of the incident shortwave solar radiation with the rarefied gas of planetary upper atmospheres It involves various processes of photolysis energetic electron impacts and accompanying numerous chemical reactions as well as processes occurring in the intermediate transition zones of planetary and cometary gas envelopes The underlying mathematical treatment is based on the stochastic approach for the solution of the Boltzmann type equation and implies the development of the efficient algorithms for its computer simulation Some results of this study were previously summarized in the monograph issued in Russian Marov et al 1990 and later in the review paper published in Space Science Reviews Marov et al 1996 The basic principles of stochastic simulation were first developed in the field of rarefied gas dynamics and were successfully applied to the solution of some engineering problems of aerodynamics and heat transfer **Mechanics of Turbulence of Multicomponent Gases** Mikhail Ya. Kolesnichenko,2006-04-18 Space exploration and advanced astronomy have dramatically expanded our knowledge of outer space and made it possible to study the in-depth mechanisms underlying various natural phenomena caused by complex interaction of physical chemical and dynamical processes in the universe Huge breakthroughs in astrophysics and the planetary sciences have led to increasingly complicated models of such media as giant molecular clouds giving birth to stars protoplanetary accretion disks associated with the solar system's formation planetary atmospheres and circumplanetary space The creation of these models was promoted by the development of basic approaches in modern mechanics and physics paralleled by the great advancement in the computer sciences As a result numerous multidimensional non-stationary problems involving the analysis of evolutionary processes can be investigated using wide range numerical experiments Turbulence belongs to the most widespread and at the same time the most complicated natural phenomena related to the origin and development of organized structures of different scale at a definite flow regime of fluids in essentially non-linear hydrodynamic systems This is also one of the most complex and intriguing sections of the mechanics of fluids The direct numerical modeling of turbulent flows encounters large mathematical difficulties while the development of a general turbulence theory is hardly possible because of the complexity of interacting coherent structures Three dimensional non

steady motions arise in such a system under loss of laminar flow stability defined by the critical value of the Reynolds number

The Sun and Space Weather Arnold Hanslmeier, 2002-06-30 Since the Sun is the main source of space weather effects the first part of the book is devoted to a general introduction to the physics of the Sun A better understanding of the phenomena underlying solar activity is also important for prediction of solar outbursts and thus for establishing alert systems for space missions and telecommunication systems The book contains the following topics possible influence of the Sun on the Earth's climate the effects of radiation on humans in space and the expected radiation dose from various solar events disturbances of the Earth's ionosphere and the implications of radio communication at different wavelength ranges possible hazardous asteroids and meteoroids and their detection and space debris and special shielding of spacecraft In the cited literature more detailed information about the topics may be found This book provides an introduction and overview of modern solar terrestrial physics for students as well as for researchers in the field of astrophysics solar physics geophysics and climate research

Multielement System Design in Astronomy and Radio Science L.E. Kopilovich, L.G. Sodin, 2001-11-30 The multielement systems have been widely used in many fields of astronomy and radio science in the last decades This is caused by the increasing demands on the resolution and sensitivity of such systems over the wide range of the electromagnetic wavelengths from gamma up to radio The ground based optical and radio interferometers gamma ray and X ray or bital telescopes antenna arrays of radio telescopes and also some other radio devices belong to scientific instruments using multielement systems Therefore the current problems of the optimal construction of such systems or precisely those of searching for the best arrangement of the elements in them were formulated A rather large number of scientific papers including those of the authors is devoted to these problems and we believe that the time has come to integrate the basic results of the papers into the monograph The offered book consists of three parts The first part is concerned with the optimal synthesis of optical and radio interferometers of various types and purposes the synthesis of non equidistant antenna arrays is considered in the second part and the methods for the construction of coded masks for X ray and gamma ray orbital telescopes are expounded in the third one Since in the text combinatorial constructions which are little known to astronomers are used the necessary information is given in the appendices Various tables containing the parameters of the systems considered are also represented

Merging Processes in Galaxy Clusters L. Feretti, I.M. Gioia, G. Giovannini, 2006-04-18 Mergers are the mechanisms by which galaxy clusters are assembled through the hierarchical growth of smaller clusters and groups Major cluster mergers are the most energetic events in the Universe since the Big Bang Many of the observed properties of clusters depend on the physics of the merging process These include substructure shock intra cluster plasma temperature and entropy structure mixing of heavy elements within the intra cluster medium acceleration of high energy particles formation

of radio halos and the effects on the galaxy radio emission This book reviews our current understanding of cluster merging from an observational and theoretical perspective and is appropriate for both graduate students and researchers in the field

Plasma Astrophysics Arnold O. Benz, 2005-11-28 This textbook is intended as an introduction to the physics of solar and stellar coronae emphasizing kinetic plasma processes It is addressed to observational astronomers graduate students and advanced undergraduates without a background in plasma physics Coronal physics is today a vast field with many different aims and goals Sorting out the really important aspects of an observed phenomenon and using the physics best suited for the case is a formidable problem There are already several excellent books oriented toward the interests of astrophysicists that deal with the magnetohydrodynamics of stellar atmospheres radiation transport and radiation theory In kinetic processes the different particle velocities play an important role This is the case when particle collisions can be neglected for example in very brief phenomena such as one period of a high frequency wave or in effects produced by energetic particles with very long collision times Some of the most persistent problems of solar physics like coronal heating shock waves flare energy release and particle acceleration are likely to be at least partially related to such processes Study of the Sun is not regarded here as an end in itself but as the source of information for more general stellar applications Our understanding of stellar processes relies heavily in turn on our understanding of solar processes Thus an introduction to what is happening in hot dilute coronae necessarily starts with the plasma physics of our nearest star *The Image Mission* James L.
