Abstract

Separability of some positional isomers of aromatic anions by capillary zone electrophoresis was improved by adding nonionic surfactants to a migrating solution. Eleven kinds of aromatic anions, including positional isomers, were used as analytes, and Brij-35, Brij-58 and Brij-78 were investigated as nonionic surfactants to form micelles, where hydrophobicities are different from each other. Increasing the concentration of the surfactants developed the separability of the anionic isomers. The interaction between the anions and the nonionic surfactant micelles is also investigated through the change in the electrophoretic mobility, and the binding constants are determined. Apparent electrophoretic mobility of the anions decreased with increasing concentrations of the nonionic surfactants. The decrease in the mobility, as well as the binding constant, was larger in the monovalent anions than in the divalent anions, which indicates that the interaction or reactivity of the monovalent analytes is higher than that of the divalent analytes. The reactivity of each anion was almost identical even when the kinds of the surfactants were changed, suggesting that the hydrophobicity of the polyoxyethylene group in the surfactant would have the main role for binding the analytes. The reactivity tendency among the positional isomers was almost similar to that in ion association-capillary zone electrophoresis using tetrabutylammonium ion as a pairing ion. The results obtained in this work suggest that the anions are bound to the micelles by the hydrophobic interaction between analyte anions and the polyoxyethylene moiety of the surfactant micelles. Changes in the fluorescence intensity of the anions were also investigated; the results can explain well the mobility changes of the analytes. © 1999 Elsevier Science B.V. All rights reserved.

1. Introduction

Micellar electrokinetic chromatography (MEKC) with anionic surfactants has been proved to be a powerful technique for the separation of non-charged substances in capillary zone electrophoresis (CZE) [1,2]. In addition to the anionic surfactants, zwitterionic surfactants [3], cyclodextrin [4,5], and organic solvents [6,7] have been used for the separability improvement in combination with the anionic

surfactants. Nonionic surfactants were also examined as modifying reagents for the MEKC separations [8–11]. However, the MEKC methods using nonionic surfactants have mainly been focused on the separation of non-charged analytes.

Recently, Matsubara and Terabe demonstrated the separability improvement of anionic dansylamino acids by a MEKC method with nonionic surfactants [12]. In the method, the hydrophobicity of analytes was considered to contribute to the distribution of analytes between the micelle and the water. The method also has a prominent advantage that high concentrations of the surfactants are allowed without
