## **Nonlinear System Analysis And Identification From Random Data:**

**Nonlinear System Analysis and Identification from Random Data** Julius S. Bendat, 1990-03-16 Describes procedures to identify and analyze the properties of many types of nonlinear systems from random data measured at the input and output points of physical systems Improvements are offered in applying older techniques and problems that traditionally have been difficult to analyze are solved by new simpler procedures Formulas are stated for optimum nonlinear system identification in both general models consisting of parallel linear bilinear and trilinear systems and special models consisting of parallel linear finite memory square law systems and finite memory cubic systems New results obtained here show when and how to replace complicated single input output nonlinear models with simpler alternative multiple input single output linear models New error analysis formulas are presented to design experiments and to evaluate estimates obtained from measured data Includes many illustrative examples

**Nonlinear system identification. 2. Nonlinear system structure identification** Robert Haber, László Keviczky, 1999 This is the second part of a two volume handbook presenting a comprehensive overview of nonlinear dynamic system identification The books include many aspects of nonlinear processes such as modelling parameter estimation structure search nonlinearity and model validity tests

Billings, 2013-09-23 Nonlinear System Identification NARMAX Methods in the Time

Frequency and Spatio Temporal Domains describes a comprehensive framework for the identification and analysis of nonlinear dynamic systems in the time frequency and spatio temporal domains This book is written with an emphasis on making the algorithms accessible so that they can be applied and used in practice Includes coverage of The NARMAX nonlinear autoregressive moving average with exogenous inputs model The orthogonal least squares algorithm that allows models to be built term by term where the error reduction ratio reveals the percentage contribution of each model term Statistical and qualitative model validation methods that can be applied to any model class Generalised frequency response functions which provide significant insight into nonlinear behaviours A completely new class of filters that can move split spread and focus energy The response spectrum map and the study of sub harmonic and severely nonlinear systems Algorithms that can track rapid time variation in both linear and nonlinear systems The important class of spatio temporal systems that evolve over both space and time Many case study examples from modelling space weather through identification of a model of the visual processing system of fruit flies to tracking causality in EEG data are all included to demonstrate how easily the methods can be applied in practice and to show the insight that the algorithms reveal even for complex systems NARMAX algorithms provide a fundamentally different approach to nonlinear system identification and signal processing for nonlinear systems NARMAX methods provide models that are transparent which can easily be analysed and which can be used to solve real problems This book is intended for graduates postgraduates and researchers in the sciences and engineering and also for users from other fields who have collected data and who wish to identify models to help to understand the dynamics of their systems Nonlinear Random Vibration Cho W.S. To,2011-08-10 This second edition of the book Nonlinear Random Vibration Analytical Techniques and Applications expands on the original edition with additional detailed steps in various places in the text It is a first systematic presentation on the subject Its features include a concise treatment of Markovian and non Markovian solutions **The Shock and Vibration Digest** ,1992 *Safety Evaluation Based on Identification Approaches Related to Time-Variant and Nonlinear Structures* Hans G. Natke,2012-12-06 Safety evaluation by definition involves many complex factors and thus covers a wide range of topics In order to focus the content of the workshop the subject matter was specific to the state of the art and the recent developments in nonlinear and time variant methods employing identification procedures Participants in the workshop represented a wide range of expertise They were selected in order to cover the state of the art of knowledge in fault detection and damage assessment system identification signal processing mathematical and physical modelling and applications of techniques such as fuzzy logic and neural networks The emphasis was placed on the exploitation and understanding of nonlinearity arising from structural or material faults Figure 1 indicates the range of topics covered in the workshop Since no unique or general approach yet exists for treating nonlinearity in the field of safety evaluation many of the topics presented were problem specific In order to assist the reader in selecting the material of primary interest a matrix of the topics covered by each

participant is shown in Table 1 This table relates the authors to the subject matter providing a guide through the diverse range of topics presented at the workshop

**The Bio-Inspired X-Structure/Mechanism Approach for Exploring Nonlinear Benefits in Engineering** Xingjian Jing,2025-07-04 This book presents a unique approach to the design and analysis of beneficial nonlinearity which can take an important and critical role in engineering systems and thus cannot be simply ignored in structural design dynamic response analysis and parameter selection A key issue in the area is thus systematically addressed about how to analyze and design potential nonlinearities introduced to or inherent in a system of under study which is a must do task in many practical applications involving vibration control energy harvesting sensor systems and robots etc This book together with several other books in this book series is to present an up to date summary on the most recent development of a cutting edge method for nonlinearity manipulation and employment developed in recent several years named as the X shaped structure or mechanism approach The X shaped structure or mechanism is a generic structure or mechanism representing a class of beneficial geometric nonlinearity with realizable and flexible linkage mechanism or structural design of different variants or forms quadrilateral diamond polygon K Z S V shape or others which all share similar geometric nonlinearity and thus similar nonlinear stiffness damping properties flexible in design and easy to implement This book is particularly to present a systematic frequency domain analysis design and optimization method of critical structural or control parameters in nonlinear systems including the X structure mechanism dynamics aiming at better dynamic performance and special nonlinear response as expected in engineering practice Cases studies in vehicle suspension energy harvesting fault detection and fuzzy membership optimization are all showcased The new analysis and design method introduced in this book definitely present a totally new and powerful approach to optimization and understanding of a class of nonlinear systems from a special frequency domain point of view
