## **Channel Power and Rate Optimization of Nonlinear Optical Fiber Networks** Ian

Roberts, 2018 Channel power and rate optimization objectives are examined in nonlinear long haul optical communication networks Problems of maximizing the minimum channel margin and maximizing fiber capacity are found to have convex forms The Kerr nonlinear inter and intra channel nonlinear interference is initially modelled via the Gaussian noise nonlinearity model Valuable performance benefits are obtained in inhomogeneous scenarios including mesh networks The inhomogeneity introduced by the additional nonlinear impairment of stimulated Raman scattering makes the optimization objective non convex but also provides inherent inhomogeneity that supports performance benefits from power optimization The discrete rate optimization objective is formulated for maximizing the real world capacity of optical communication systems with discrete code rates Efficient heuristic methods are proposed that make use of a sequence of calls to solve the minimum margin channel power optimization problem Lastly the channel power optimization problem is generalized with a model that applies beyond the dispersion uncompensated domain of the Gaussian noise model A first order perturbation based approach is used for the nonlinear interference modelling
