Numerical Methods for Wave Equations in Geophysical Fluid Dynamics Dale R. Durran, 2013-01-11 Covering a wide range of techniques this book describes methods for the solution of partial differential equations which govern wave propagation and are used in modeling atmospheric and oceanic flows The presentation establishes a concrete link between theory and practice Numerical Methods for Fluid Dynamics Dale R. Durran, 2010-09-14 This scholarly text provides an introduction to the numerical methods used to model partial differential equations with focus on atmospheric and oceanic flows The book covers both the essentials of building a numerical model and the more sophisticated techniques that are now available Finite difference methods spectral methods finite element method flux corrected methods and TVC schemes are all discussed Throughout the author keeps to a middle ground between the theorem proof formalism of a mathematical text and the highly empirical approach found in some engineering publications The book establishes a concrete link between theory and practice using an extensive range of test problems to illustrate the theoretically derived properties of various methods From the reviews the books unquestionable advantage is the clarity and simplicity in presenting virtually all basic ideas and methods of numerical analysis currently actively used in geophysical fluid dynamics Physics of Atmosphere and Ocean

Numerical Methods of Exploration Seismology Gary F. Margrave, Michael P. Lamoureux, 2019-01-10 Exploration seismology uses seismic imaging to form detailed images of the Earth's interior enabling the location of likely petroleum targets. Due to the size of seismic datasets sophisticated numerical algorithms are required. This book provides a technical

guide to the essential algorithms and computational aspects of data processing covering the theory and methods of seismic imaging The first part introduces an extensive online library of MATLAB seismic data processing codes maintained by the CREWES project at the University of Calgary Later chapters then focus on digital signal theory and relevant aspects of wave propagation and seismic modelling followed by deconvolution and seismic migration methods Presenting a rigorous explanation of how to construct seismic images it provides readers with practical tools and codes to pursue research projects and analyses It is ideal for advanced students and researchers in applied geophysics and for practicing exploration geoscientists in the oil and gas industry Mathematical Methods in the Earth and Environmental Sciences Adrian Burd, 2019-04-18 An accessible introduction to the mathematical methods essential for understanding processes in the Earth and environmental sciences A Mathematical Introduction to Fluid Mechanics Alexandre J. Mountain Weather Research and Forecasting Fotini K. Chow, Stephan F.J. De Wekker, Bradley J. Snyder, 2012-08-30 This book provides readers with a broad understanding of the fundamental principles driving atmospheric flow over complex terrain and provides historical context for recent developments and future direction for researchers and forecasters The topics in this book are expanded from those presented at the Mountain Weather Workshop which took place in Whistler British Columbia Canada August 5 8 2008 The inspiration for the workshop came from the American Meteorological Society AMS Mountain Meteorology Committee and was designed to bridge the gap between the research and forecasting communities by providing a forum for extended discussion and joint education For academic researchers this book provides some insight into issues important to the forecasting community For the forecasting community this book provides training on fundamentals of atmospheric processes over mountainous regions which are notoriously difficult to predict The book also helps to provide a better understanding of current research and forecast challenges including the latest contributions and advancements to the field The book begins with an overview of mountain weather and forecasting challenges specific to complex terrain followed by chapters that focus on diurnal mountain valley flows that develop under calm conditions and dynamically driven winds under strong forcing The focus then shifts to other phenomena specific to mountain regions Alpine foehn boundary layer and air quality issues orographic precipitation processes and microphysics parameterizations Having covered the major physical processes the book shifts to observation and modelling techniques used in mountain regions including model configuration and parameterizations such as turbulence and model applications in operational forecasting The book concludes with a discussion of the current state of research and forecasting in complex terrain including a vision of how to bridge the gap in the future Monthly Weather Review ,1980
