ABSTRACT. Ductility in metals includes the material's capability to tolerate plastic deformations before partial or total degradation of its mechanical properties. Modelling this parameter is important in structure and component design because it can be used to estimate material failure under a generic multi-axial stress state. Previous work has attempted to provide accurate descriptions of the mechanical property degradation resulting from the formation, growth, and coalescence of microvoids in the medium. Experimentally, ductile damage is inherently linked with the accumulation of plastic strain; therefore, coupling damage and elastoplasticity is necessary for describing this phenomenon accurately. In this paper, we combine the approach proposed by Lemaitre with the features of an unconventional plasticity model, the extended subloading surface model, to predict material fatigue even for loading conditions below the yield stress.

KEYWORDS. Unconventional plasticity; Ductile damage; Subloading surface; Cyclic loading.

INTRODUCTION

The degradation of material properties, which results from the initiation of cavities and microcracks induced by large plastic deformations, has been widely studied. Material failure results from microscopic material imperfections, which cause the formation and coalescence of microvoids that eventually produce cracks during deformation. Modelling this mechanism is important in many industrial processes for creating optimized reliable designs for structures and components.

There are two main models for the elastoplastic framework [1, 2]: Gurson's void growth model [3] and Lemaitre's model [4, 5], often referred as continuum damage mechanics. Gurson's model is based on void growth, where the plastic yield is inversely proportional to the amount of imperfections; as the porosity increases the material loading decreases. Further studies by Needleman and Tvergaard [6], Koppic and Needleman [7], and Ohata and Toyota [8] extended the damage evolution concept by introducing material parameters to model the acceleration of the degradation of mechanical properties. Lemaitre's theory describes damage as an internal variable and models its evolution with a dissipative potential

Advances in Damage Mechanics: Metals and Metal Matrix Composites George Voyiadjis, 2012-12-02 This book provides in a single and unified volume a clear and thorough presentation of the recent advances in continuum damage mechanics for metals and metal matrix composites Emphasis is placed on the theoretical formulation of the different constitutive models in this area but sections are added to demonstrate the applications of the theory In addition some sections contain new material that has not appeared before in the literature The book is divided into three major parts Part I deals with the scalar formulation and is limited to the analysis of isotropic damage in materials Parts II and III deal with the tensor formulation and is applied to general states of deformation and damage The material appearing in this text is limited to plastic deformation and damage in ductile materials e g metals and metal matrix composites but excludes many of the recent advances made in creep brittle fracture and temperature effects since the authors feel that these topics require a separate volume for this presentation Furthermore the applications presented in this book are the simplest possible ones and are mainly based on the uniaxial tension test

Damage Mechanics D. Krajcinovic, 1996-04-22 This book provides the first truly comprehensive study of damage mechanics All concepts are carefully identified and defined in micro and macroscopic scales In terms of the methods and observation scales the main part of the book is divided into three chapters These chapters consider the stochastic models applied to atomistic scale micromechanical models for arbitrary concentrations of defects on microscopic scale and continuum models on the macroscopic scale It is intended for people who are doing or planning to do research in the mechanics and material science aspects of brittle deformation of solids with heterogeneous microstructure

Symposium on Multiscale Modelling of Damage and Fracture Processes in Composite Materials Tomasz Sadowski, 2006-07-06 The IUTAM Symposium on Multiscale Modelling of Damage and Fracture Processes in Composite Materials was held in Kazimierz Dolny Poland 23-27 May 2005. The Symposium was attended by 48 persons from 15 countries. During 5-day meeting 4 keynote lectures and 39 invited lectures were presented. This volume constitutes the Proceedings of the IUTAM Symposium. The main aim of the Symposium was to discuss the basic principles of damage growth and fracture processes in different types of composites: ceramic polymer and metal matrix composites, cement and bituminous composites, and wood. Nowadays it is widely recognized that important macroscopic properties like the macroscopic stiffness and strength are governed by processes that occur at one to several scales below the level of observation, starting from nanoscale. Understanding how these processes influence the reduction of stiffness and strength is essential for the analysis of existing and the design of improved composite materials. The study of how these various length scales can be linked together or taken into account simultaneously is particularly attractive for composite materials since they have a well-defined structure at the nano, micro, and meso levels. The well-defined microstructural level can be associated with small particles or fibres, while the individual laminae can be identified at the mesoscopic level. Moreover, the advances in multiscale modelling of damage and fracture processes to the description of the complete constitutive behaviour in composites which do not have a very well-defined microstructure, e.g. cementitious, bituminous composites, and wood, were analysed.
