Numerical Taxonomy The Principles And Practice Of Numerical Classification A Series Of In Biology:

Numerical taxonomy Peter Henry Andreas Sneath, Robert Reuben Sokal, 1973 Numerical Taxonomy (by) Peter H.A. Sneath (and) Robert R. Sokal Peter Henry Andrews Sneath, 1973 *Numerical Taxonomy* Joseph Felsenstein, 1983 The NATO Advanced Study Institute on Numerical Taxonomy took place on the 4th 16th of July 1982 at the Kur und Kongresshotel Residenz in Bad Windsheim Federal Republic of Germany This volume is the proceedings of that meeting and contains papers by over two thirds of the participants in the Institute Numerical taxonomy has been attracting increased attention from systematists and evolutionary biologists It is an area which has been marked by debate and conflict sometimes bitter Happily this meeting took place in an atmosphere of Gemütlichkeit though scarcely of unanimity I believe that these papers will show that there is an increased understanding by each taxonomic school of each others positions This augurs a period in which the debates become more concrete and specific Let us hope that they take place in a scientific atmosphere which has occasionally been lacking in the past Since the order of presentation of papers in the meeting was affected by time constraints I have taken the liberty of rearranging them into a more coherent subject ordering The first group of papers taken from the opening and closing days of the meeting debate philosophies of classification The next two sections have papers on congruence clustering and ordination A notable concern of these participants is the comparison and testing of classifications This has been missing from many previous discussions of numerical classification **Principles of Numerical Taxonomy** Robert R. Sokal, Peter Henry Andrews Sneath, 1963 An Introduction to Numerical Classification Bozzano G Luisa, 2012-12-02 An Introduction to Numerical Classification describes the rationale of numerical analyses by means of geometrical models or worked examples without possible extensive algebraic symbolism Organized into 13 chapters the book covers both the taxonomic and ecological aspects of numerical classification After briefly presenting different terminologies used in this work the book examines several types of biological classification including classification by structure proximity similarity and difference It then describes various ecological and taxonomic data manipulations such as data reduction transformation and standardization Other chapters deal with the criteria for best computer classification and the complexities and difficulties in this classification These difficulties are illustrated by reference to studies of the bottom communities of benthic marine invertebrates ranging across the entire field from the sampling program and nature of the data to problems over the type of computer used The concluding chapters consider some of the measures of diversity and the interpretations which have been made from them as well as the relationship of diversity to classification The concept and application in biological classification of various multivariate analyses are also discussed in these texts Supplemental texts on the information measures partitioning and interdependence of data diversity are also provided This book is of value to biologists and researchers who are interested in basic biological numerical classification **Principles of Numerical Taxonomy [by] Robert R. Quicke, 2013-03-13 Taxonomy is an ever changing controversial and exciting field of biology. It has not remained motionless since the days of its founding fathers in the last century but just as with other fields of endeavour it continues to advance in leaps and bounds both in procedure and in philosophy. These changes are not only of interest to other taxonomists but have far reaching implications for much of the rest of biology and they have the potential to reshape a great deal of current biological thought because taxonomy underpins much of biological methodology. It is not only important that an ethologist, physiologist, biochemist or ecologist can obtain information about the identities of the species which they are investigating; biology is also uniquely dependent on the comparative method and on the need to generalize. Both of these necessitate knowledge of the evolutionary relationships between organisms and it is the science of taxonomy that can develop testable phylogenetic hypotheses and ultimately provide the best estimates of evolutionary history and relationships.
