notably streptomycin, can decrease biotin levels. Dietary biotin deficiency is rare in humans, with the exception of seborrheic dermatitis seen in infants under 6 months of age and during hemodialysis and long-term total parenteral nutrition without added biotin and following extensive bowel resection. Deficiency has also been reported after long-term anticonvulsant therapy. Ingestion of large amounts of raw egg white can induce biotin deficiency, producing a syndrome characterized by scaly dermatitis, muscle pains, alopecia, glossitis, mental depression, and general malaise. There is one rare disorder with biotin dependency in which an abnormality in the carboxylation of propionic acid leads to a ketotic hyperglycemia. There are no reports of biotin toxicity with excessive intake. See
