

RECENT ADVANCES IN PSYCHOPHARMACOLOGY OF DEPRESSION*

G. F. S. JOHNSON

Clearly a brief discussion of recent advances must needs be selective and I have chosen to present areas with direct clinical relevance.

1. Plasma level monitoring

(a) Plasma lithium. This is a well established and essential procedure for optimum therapeutic control, both in acute mania and long term maintenance of manic depressive illness. The range of plasma levels is based on the standard 12-14 hour serum lithium and in practice this is the level obtained in the morning, taken before medication, 12-14 hours after the evening dose. Pharmacokinetic analysis has shown that at this point on the plasma curve the reliability of measurement in individual patients and between patients is satisfactory. Such standardisation allows changes in plasma level, due to alterations in elimination or compliance to be readily recognised. The range of plasma levels recommended for long term maintenance, particularly the minimum therapeutic level is ill defined. Mean plasma lithium levels in reported studies range from mean of 0.9 mmol/l (Vestergaard *et al.*, 1979) down to a mean of 0.59 mmol/l (Hullin *et al.*, 1979). The mean in our lithium clinic population is 0.65 mmol/l. No comparative data are available in relationship to effectiveness but we may assume that these levels have been arrived at in the various centres on the basis of individually adjusted effective dose. To define the lower therapeutic level more systematically Hullin (1978) investigated the minimum concentration of plasma lithium necessary to prevent relapse in recurrent affective disorder in 73 patients, both unipolar and bipolar, who had been on lithium for an average period of approximately five years at the start of

the study. They were allocated to one of three groups with plasma lithium levels maintained below 0.49, between 0.50 and 0.69, and above 0.70 mmol/l respectively. After a year on the new levels the relapse rate showed surprisingly little difference between groups.

In the following year levels were lowered to below 0.4, between 0.4 - 0.59 and over 0.6. Significantly more patients with levels below 0.40 mmol/l relapsed in the second year.

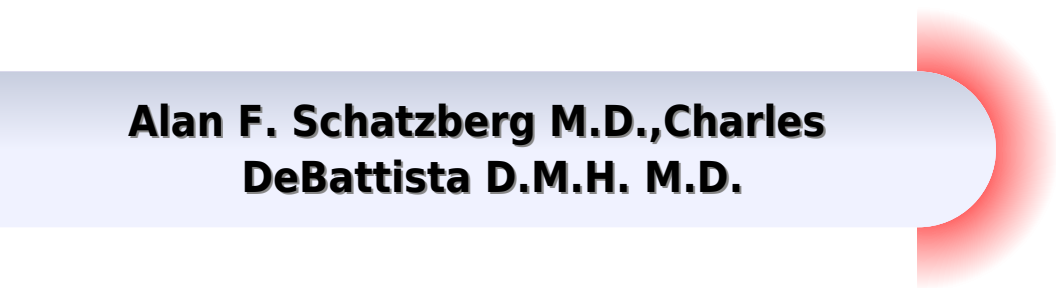

This would suggest a wider therapeutic range with effective levels down to 0.40 mmol/l. In view of concern relating to nephrotoxicity with long term administration, the plasma levels should be maintained at the lowest concentration commensurate with adequate clinical control and tolerance. Evaluation of renal function in our lithium treated patients was reported earlier but suffice it to say that we did not find evidence of nephrotoxicity. This is in agreement with Hullin (1978) whose mean plasma lithium levels of 0.59 mmol/l are in close approximation to those in our population with a mean of 0.6 mmol/l. However this contrasts with the Scandinavian report where the mean plasma lithium levels were of the order of 0.9 mmol/l; levels associated with reported nephrotoxicity.

As lithium is rapidly absorbed and eliminated, wide fluctuations in plasma levels may be minimised by giving divided doses. This poses problems with compliance and sustained release preparations have been developed in an attempt to provide a once a day dosage. In Australia, Priadel is a sustained release lithium carbonate that has been marketed with these claims. A study of plasma levels and urinary excretion in normal volunteers showed that Priadel is a delayed release rather than a true sustained release, with concentration maximum occurring at around four

Pharmacotherapy for Mood, Anxiety, and Cognitive Disorders Uriel Halbreich,Stuart A. Montgomery,2008-11-01 Our limited knowledge of the pathophysiology underlying mood disorders contrasts sharply with the efficacy of the treatment modalities developed over the past decades There has been an explosion of new antidepressant and anxiolytic medications as well as mood stabilizers and compounds that aim to improve cognition Although treatment success is still not optimal pharmacotherapy for mood disorders and cognitive disorders is effective and is improving Pharmacotherapy for Mood Anxiety and Cognitive Disorders takes a critical look at the medications available for treating mood anxiety and cognitive disorders their relevance to pathobiology and underlying mechanisms and their limitations Its 90 distinguished contributors

many of them pioneers in the development of treatment modalities provide background and rationale in understanding the underlying mechanisms of frontline treatments for these disorders This book reviews Effective new alternatives in mood stabilizers and antidepressant interventions Advances in the study of the pathobiology of anxiety disorders as well as available treatment choices including anxiolytic medications Several treatment approaches to dementia and other age related cognitive impairments Gender differences in the treatment of depression and anxiety and the different responses to pharmacotherapy New treatments for social phobia and pharmacological strategies for cognitive disorders Providing both a broad overview and detailed reviews of pharmacotherapy this resource is essential reading for any practitioner who wants to understand the rationale and background for the drugs he or she prescribes and to assess medications that are currently under development It is a great reference and ancillary text for students and residents during their clinical years

Treatment-Resistant Depression Siegfried Kasper, Stuart A. Montgomery, 2013-02-06 Treatment resistant Depression Successful management of patients with treatment resistant depression requires a thorough understanding of the biological basis for both the depression and its failure to respond to standard treatments This book clearly and succinctly summarizes the latest scientific research and its applications in clinical practice A first step is a clear definition of what constitutes treatment resistant depression so that clinical trials and other studies are using common criteria enabling comparison and meta analysis of their outcomes The opening chapter reviews definitions and predictors of treatment resistant depression originating from different fields and discusses their usefulness in clinical practice and clinical research The next chapter proposes a new definition adapting terminology from medicine Biological classification requires identification of genetic risk factors and gene variants have been identified as accounting for 50% of the variance in the clinical outcomes of antidepressant treatments Chapter 3 describes several genes already associated with treatment resistant depression and while further work is needed to translate findings into clinical recommendations suggests that genetic prediction of treatment resistance could become a widespread clinical reality within a few years Most patients with treatment resistant depression will be treated pharmacologically so three chapters review the latest evidence for pharmacological best practice in switching strategies for antidepressants the role of antipsychotics and augmentation strategies to complement lithium There are two major alternatives to pharmacotherapy neuromodulation and psychotherapy The brain intervention chapter summarizes clinical research and experience with electroconvulsive therapy transcranial magnetic stimulation vagus nerve stimulation deep brain stimulation and magnetic seizure therapy The final chapter reviews the literature pertaining to the effectiveness of various forms of psychotherapy in patients who have not responded to antidepressant pharmacotherapy explaining that patients who have not responded to one or two trials of antidepressant medication have a 30% 50% chance of responding to a focused psychotherapy It proposes indications for psychotherapy in treatment resistant depression and summarizes general therapeutic principles Essential reading for all psychiatrists managing patients with this distressing

disorder
