Robot Sensors Alan Pugh, 1986 V 1 Vision v 2 Tactile and non vision Advanced Tactile Sensing For Robotics Howard R Nicholls, 1992-12-10 Advanced robot systems require sensory information to enable them to make decisions and to carry out actions in a versatile autonomous way Humans make considerable use of information derived through touch and an emerging domain of robot sensing is tactile sensing This book considers various aspects of tactile sensing from hardware design through to the use of tactile data in exploratory situations using a multi fingered robot hand In the first part of the book the current state of progress of tactile sensing is surveyed and it is found that the field is still in an early stage of development Next some fundamental issues in planar elasticity concerning the interaction between tactile sensors and the environment are presented Having established how the basic data can be derived from the sensors the issues of what form tactile sensors should take and how they should be used are considered This is particularly important given the infancy of this field The human tactile system is examined and then biological touch and its implications for robotics is looked at Some experiments in dextrous manipulation using a robot hand are described which apply some of these results The integration of tactile sensors into a complete system is also considered and another novel approach for using touch sensing in a flexible assembly machine is described Both basic material and new research results are provided in this book thus catering to different levels of readers The chapters by world experts in different aspects of the field are integrated well into one volume The editor and authors have produced a thorough and in depth survey of all work in robot tactile sensing making the book essential reading for all researchers in this emergent field *Sensor Devices and Systems for Robotics* Alicia Casals, 2012-12-06 As robots improve in efficiency and intelligence there is a growing need to develop more efficient accurate and powerful sensors in accordance with the tasks to be robotized This has led to a great increase in the study and development of different kinds of sensor devices and perception systems over the last ten years Applications that differ from the industrial ones are often more demanding in sensorics since the environment is not usually so well structured Spatial and agricultural applications are examples of situations where the environment is unknown or variable Therefore the work to be done by a robot cannot be strictly programmed and there must be an interactive communication with the environment It cannot be denied that evolution and development in robotics are closely related to the advances made in sensorics The first vision and force sensors utilizing discrete components resulted in a very low resolution and poor accuracy However progress in VLSI imaging devices and other technologies have led to the development of more efficient sensor and perception systems which are able to supply the necessary data to robots Robot Tactile Sensing R. Andrew Russell, 1990 This work introduces tactile sensing for those engaged in advanced sensor based robotics with special reference to problems of addressing arrays of sensor elements It describes tactile sensors to register contact surface profile thermal properties and other tactile sensing modes The use of robot manipulators to provide mobility for tactile sensors and techniques for applying tactile sensing in

robotic manipulation and recognition tasks are also covered The various applications of this technology are discussed and robot hands and grips are detailed Handbook Of Industrial Automation Richard Shell,2000-08-29 Supplies the most essential concepts and methods necessary to capitalize on the innovations of industrial automation including mathematical fundamentals ergonometics industrial robotics government safety regulations and economic analyses *Advanced Robotics & Intelligent Machines* J. O. Gray,Darwin G. Caldwell,1996 Advanced robotics describes the use of sensor based robotic devices which exploit powerful computers to achieve the high levels of functionality that begin to mimic intelligent human behaviour The object of this book is to summarise developments in the base technologies survey recent applications and highlight new advanced concepts which will influence future progress Three-Dimensional Object Recognition from Range Images Minsoo Suk,Suchendra M.
