Autonomous Robots Research Advances Weihua Yang, 2008 Autonomous robots are robots which can perform desired tasks in unstructured environments without continuous human guidance Many kinds of robots have some degree of autonomy Different robots can be autonomous in different ways A high degree of autonomy is particularly desirable in fields such as space exploration where communication delays and interruptions are unavoidable Some modern factory robots are autonomous within the strict confines of their direct environment The exact orientation and position of the next object of work and in the more advanced factories even the type of object and the required task must be determined This can vary unpredictably at least from the robot's point of view One important area of robotics research is to enable the robot to cope with its environment whether this be on land underwater in the air underground or in space This book presents the latest research from around the globe

Field and Service Robotics Alonzo Kelly, Karl Iagnemma, Andrew Howard, 2010-06-28 Robotics is undergoing a major transformation in scope and dimension. From a largely dominant industrial focus robotics is rapidly expanding into human environments and vigorously engaged in its new challenges. Interacting with assisting serving and exploring with humans the emerging robots will increasingly touch people and their lives. Beyond its impact on physical robots the body of knowledge robotics has produced is revealing a much wider range of applications reaching across diverse research areas and scientific disciplines such as biomechanics haptics neurosciences virtual simulation animation surgery and sensor networks among others. In return the challenges of the new emerging areas are proving an abundant source of stimulation and insights for the field of robotics. It is indeed at the intersection of disciplines that the most striking advances happen. The Springer Tracts in Advanced Robotics STAR is devoted to bringing to the research community the latest advances in the robotics field on the basis of their significance and quality. Through a wide and timely dissemination of critical research developments in robotics our objective with this series is to promote more exchanges and collaborations among the researchers in the community and contribute to further advancements in this rapidly growing field.

Experimental Robotics VI Peter I. Corke, James Trevelyan, 1999-10-22 This book presents the proceedings of the 6th International Symposium on Experimental Robotics held in Sydney in March 1999. The editors and contributors represent the leading robotics research efforts from around the world. Micro machines interplanetary exploration minimally invasive surgery and emerging humanoid robots are among the most obvious attainments of leading robotics research teams reported in this volume. Less obvious but equally significant are the fundamental advances in robot map building and methods of communication between humans and machines that are demonstrated through experimental results. This collection of papers will provide the reader with a concise report on the current achievements and future trends in robotics research across the world.

Active Matter Skylar Tibbits, 2017-09-29 The first book on active matter an emerging field focused on programming physical materials to assemble themselves transform autonomously and react to information. The past few decades brought a revolution in computer software and hardware today we are on the cusp of a materials revolution. If yesterday we programmed computers and other machines today we program matter itself. This has created new capabilities

in design computing and fabrication which allow us to program proteins and bacteria to generate self transforming wood products and architectural details and to create clothing from intelligent textiles that grow themselves This book offers essays and sample projects from the front lines of the emerging field of active matter Active matter and programmable materials are at the intersection of science art design and engineering with applications in fields from biology and computer science to architecture and fashion These essays contextualize current work and explore recent research Sample projects generously illustrated in color show the range of possibilities envisioned by their makers Contributors explore the design of active material at scales from nano to micro kilo and even planetary They investigate processes of self assembly at a microscopic level test new materials that can sense and actuate themselves and examine the potential of active matter in the built environment and in living and artificial systems Active Matter is an essential guide to a field that could shape the future of design
