A. Deer, Robert Andrew Howie, J. Zussman, 1982-12-01 A second edition in two parts of Volume 1 of this well known reference series This volume deals mainly with the olivine and garnet groups and also the humite group zircon sphene vesuvianite the  $Al_2SiO_5$  including mullite topaz staurolite and chloritoid The disilicates and ring silicates are covered in Volume 1B In the years since the first edition was published the quantity and scope of research on the olivines garnets and the aluminosilicates has grown enormously and has given rise to a wide variety of literature This book which has been completely rewritten and considerably expanded summarizes the important research results and presents them in an organized fashion Each mineral chapter is divided into sections on structure chemistry optical and physical properties distinguishing features and paragenesis Each chapter is headed by a tabulation of mineral data and a sketch showing optical orientation and concludes with full references to the literature Diagrams of the crystal structures are presented and are followed by a discussion of the structural features The chemical sections include a large number of analyses from which structural formulae have been calculated illustrating the chemical and paragenetical variation exhibited by each mineral phase equilibria in relevant systems are fully considered In the sections on optical and physical properties particular attention is paid to the correlation of these properties with chemical composition The principal modes of occurrence are described and discussed in the paragenesis sections here again correlation with chemistry is emphasized 11 volumes are available in this series      *Rock-forming Minerals* William Alexander Deer, Robert Andrew Howie, J. Krivolutsкая, 2015-12-09 This book addresses fundamental problems in the evolution of magmatic and ore forming processes in the Noril'sk area of northern Central Siberia Based on data on the geology and geochemistry of rocks obtained by the author in the course of fieldworks and new analytical studies applying XRF ICP MS microprobe analysis ion probe analysis and studying melt and fluid inclusions in olivine as well as stable and radiogenic isotopes in the rocks it was proposed a new scheme for the evolution of magmatism including two episodes rift and trap per se The ultramafic mafic massifs are classified into three geochemical types the most important of which the ore bearing Noril'sk type was formed in post Nadezhdinsky time as an independent pulse of magmatic activity The primary melts for ore bearing intrusions had tholeiitic composition with elevated MgO 8 wt% and low volatile contents data from melt inclusions in olivine and pyroxenes in combination with numerical simulations using the COMAGMAT program package The assimilation of host rocks by the parental melts was studied in the contact zones of the Maslovsky and Talnakh intrusions It was shown that it had taken place only in narrow zones about 1-2 m and did not play sufficient role in ore formation It was suggested that the source of the material was lower crustal rocks in long lived rift zones where sulfides accumulated in several stages The book offers a valuable resource for specialists in the geology of ore deposits and petrology as well as for advanced Geology students      **Evolution of Magmatic and Diamond-Forming Systems of the Earth's Lower Mantle** Anna V.
