Role Of Neurotransmitters In Brain Injury:

The Role of Neurotransmitters in Brain Injury W.D. Dietrich, M.Y.T. Globus, 2012-12-06 Neuroscientists from various disciplines have given extraordinary attention to the role of neurotransmitters in the field of neuronal injury. This volume summarizes the original oral and poster contributions which were presented at the symposium The Role of Neurotransmitters in Brain Injury in Key West, Florida, between June 7-9, 1991. This symposium was the official Satellite of Brain 91, the Fifteenth International Symposium on Cerebral Blood Flow and Metabolism, held in Miami the previous week. The two principal goals of the Key West satellite meeting were to document recent progress and more importantly to explore future directions for investigative studies of the role of neurotransmitters in brain injury. To achieve these goals, we assembled participants from diverse scientific fields and specialties who brought their collective expertise to discussions on the importance of neurotransmitters in neuronal and vascular injury following brain ischemia, trauma, and epilepsy. Their contributions are reflected in this volume. An important section of this volume is devoted to the role of glutamate and glutamatergic receptors in the development of ischemic neuronal damage. Topics covered include the mechanisms of glutamate and other excitatory amino acids and the role of underlying injury-induced release of different glutamatergic receptors in brain injury, including the NMDA and the non-NMDA receptors. The involvement of other neurotransmitters in the process of ischemic brain injury is well established.

New Insights and Perspectives on Traumatic Brain Injury: Integration, Translation and Multidisciplinary Approaches Zhou Zhou, Jifeng Cai, Xianping Du, Jian Shi, 2024-07-01. Traumatic brain injury (TBI) remains one of healthcare's most significant challenges and policy-making. TBI could not only lead to long-term functional impairment but also a decrease in quality of life. Lowering the mortality risk and benefitting survivors' living quality remains the target of neurotrauma studies globally. With the advent of novel TBI-related clinical and basic research approaches, diagnostics, therapeutics, research, and novel and multidisciplinary methods have emerged. Despite promising progress, no completely effective treatment prevents or minimizes TBI and its related neurological and psychiatric sequelae. Understanding the mechanisms underlying the pathophysiology, treatment progress, and clinically based translational and engineering research on TBI may pave the way for potential treatment targets, diagnostic markers, and preventive methods that ultimately lead to efficacious therapeutic strategies. This Research Topic aims to disseminate high-quality TBI and related research, especially for the comprehensive and in-depth study in integration, translation, and multidisciplinary approaches in TBI research, including new technology and research methods in clinical neurology, new findings in neuroendocrinology, neuropathology, and new development in neuropharmacology, neurophysiology,
