Multilayers Lawrence H Bennett, Dick Watson, 1994-12-16 This book focuses on an increasingly important area of materials science and technology namely the fabrication and properties of artificial materials where slabs of magnetized materials are sandwiched between slabs of nonmagnetized materials It includes reviews by experts on the theory and descriptions of the various experimental techniques such as those using nuclear or electron spin probes as well as optical X ray or neutron probes It also reviews potential applications such as the giant magnetoresistance and one specialized preparation technique the electrodeposition The various chapters are tutorial in nature making the subject accessible to nonspecialists as well as useful to researchers in the field *Optics in Magnetic Multilayers and Nanostructures* Stefan Visnovsky, 2018-10-03 In the

continuing push toward optical computing the focus remains on finding and developing the right materials Characterizing materials understanding the behavior of light in these materials and being able to control the light are key players in the search for suitable optical materials Optics in Magnetic Multilayers and Nanostructures presents an accessible introduction to optics in anisotropic magnetic media While most of the literature presents only final results of the complicated formulae for the optics in anisotropic media this book provides detailed explanations and full step by step derivations that offer insight into the procedure and reveal any approximations Based on more than three decades of experimental research on the subject the author explains the basic concepts of magneto-optics nonreciprocal wave propagation the simultaneous effect of crystalline symmetry and arbitrarily oriented magnetization on the form of permittivity tensors spectral dependence of permittivity multilayers at polar longitudinal transverse and arbitrary magnetization the effect of normal or near normal incidence on multilayers and anisotropic multilayer gratings Making the subject of magneto-optics and anisotropic media approachable by the nonspecialist Optics in Magnetic Multilayers and Nanostructures serves as an ideal introduction to newcomers and an indispensable reference for seasoned researchers **Magnetic Multilayers** Lawrence Herman

*Magnetic Ultra Thin Films, Multilayers and Surfaces* F. Petroff, M.A.M. Gijs, 1997-12-18. The Symposium on Magnetic Ultrathin Films Multilayers and Surfaces hosted by the European Materials Research Society was held at the Palais de la Musique et des Congrès in Strasbourg France on June 4-7 1996. Its central theme was the relationship of magnetic properties and device performance to structure at the nano and micrometer length scale. Research on the magnetism of surfaces ultrathin films and multilayers has increased dramatically during recent years. This development was triggered by the discovery of coupling between ferromagnetic layers across nonmagnetic spacer layers and of the giant magnetoresistance effect in systems of reduced dimension using various micro and nanofabrication techniques. This has become a subject of special interest. It is certainly the promising application potential of these effects in new magnetic recording device geometries which causes this intensive research which is done both by companies and at universities and research institutes. A selection of invited and contributed papers presented at the Symposium and accepted for publication is contained in this volume. The contents of these proceedings are organized into seven sections: A Nanowires Nanoparticles Nanostructuring B Ultrathin Films and Surfaces Characterization C Giant Magnetoresistance D Coupling Tunneling E Growth Structure Magnetism F Growth Structure Magnetoresistance G Coupling Magnetic processes Magneto optics. The first four sections contain invited and oral contributed papers in the listed research domains while the last three sections contain the contributions presented during three large poster sessions.

*Magnetic Thin Films, Multilayers and Superlattices* A. Fert, G. Güntherodt, B. Heinrich, E.E. Marinero, M. Maurer, 1991-06-06. Materials Research in thin and ultrathin magnetic structures is a multidisciplinary field which heavily relies on state of the art growth characterization and theoretical approaches to build a comprehensive physical picture on how magnetic properties depend on interfacial structural issues interlayer coupling and transport phenomena. Often in this field the critical properties and characterization required necessitates knowledge of structural and magnetic phenomena extending over several atomic planes. Atomic controlled growth techniques are required and atomic sensitivity is needed from magnetic and structural probes. This critical knowledge is vital for device applications providing the basis for the synergistic interactions that are predominant in this field of research. This volume is the definitive reference source for anyone interested in the latest advances and results of current experimental research in ultrathin film magnetism.

**Advanced Magnetic Nanostructures** D.J. Sellmyer, Ralph Skomski, 2006-07-02 Advanced magnetic nanostructures is an emerging field in magnetism and nanotechnology but the literature consists of a rich variety of original papers and parts of reviews and books whose scope is comparatively broad This calls for a book with specific emphasis on state of the art synthetic methods for fabricating characterizing and theoretically modeling new magnetic nanostructures This book is intended to provide a comprehensive overview of the present state of the field Leading researchers world wide have contributed a survey of their special ties to guide the reader through the exploding literature in nanomagnetic structures The focus is on deliberately structured nanomagnets It includes cluster assembled self organized and patterned thin films but excludes for example multilayered thin films We target both industrial and academic researchers in magnetism and related areas such as nanotechnology materials science and theoretical solid state physics

Nanomagnetism ,2006-03-27 Nanoscience is of central importance in the physical and biological sciences and is now pervasive in technology However nanomagnetism has a special role to play as magnetic properties depend uniquely on both dimensionality and lengthscales Nanomagnetism is already central to data storage sensor and device technologies but is increasingly being used in the life sciences and medicine This volume aims to introduce scientists computer scientists engineers and technologists from diverse fields to this fascinating and technologically important new branch of nanoscience The volume should appeal to both the interested general reader but also to the researcher wishing to obtain an overview of this fast moving field The contributions come from acknowledged leaders in the field who each give authoritative accounts of key fundamental aspects of nanomagnetism to which they have themselves made a major contribution After a brief introduction by the editors Wu first surveys the fundamental properties of magnetic nanostructures The interlayer exchange interactions within magnetic multilayer structures is next discussed by Stiles Camley then discusses the static dynamic and thermal properties of magnetic multilayers and nanostructures followed by an account of the phenomenon of exchange anisotropy by Berkowitz and Kodama This latter phenomenon is widely in current read head devices for example The transport properties of nanostructures also are spectacular and again underpin computer technology as we see from the discussion of giant magnetoresistance GMR and tunnelling magnetoresistance TMR presented by Fert and his colleagues Beyond GMR and TMR we look to the field of spintronics where new electronic devices are envisioned and for which quantum computing may depend as discussed in the chapter by Flatte and Jonker The volume concludes with discussion of the recently discovered phenomenon of current

induced switching of magnetization by Edwards and Mathon Subject is in the forefront of nanoscience All Section authors are leading figures in this key field Presentations are accessible to non specialists with focus on underlying fundamentals

*Fundamental Properties Of Nanostructured Materials - Proceedings Of The National School Of The Condensed Matter Group* Dino Fiorani, Giorgio Sberveglieri, 1994-10-26 The purpose of this school addressed to young researchers and graduate students physicists chemists and engineers was to provide the basis of fundamental properties of nanostructured materials and an introduction to more specialized and up to date topics The topics were remarkably interdisciplinary covering theory materials preparation structural characterization thermodynamic aspects and mechanical optical electrical and magnetic properties

*Nanomagnetism and Spintronics* Jun-ichiro Inoue, 2013-10-07 Novel magnetotransport phenomena appear when magnet sizes become nanoscale Typical examples of such phenomena are giant magnetoresistance GMR in magnetic multilayers tunnel magnetoresistance TMR in ferromagnetic tunnel junctions and ballistic magnetoresistance BMR in magnetic nanocontacts In this chapter we first briefly review the relationship between spin dependent resistivity and electronic structures in metals and alloys and describe microscopic methods for investigating electrical transport We then review the essential aspects of GMR TMR and BMR emphasizing the role of the electronic structures of the constituent metals of these junctions and the effects of roughness on the electrical resistivity or resistance The important factors that control GMR are shown to be the spin dependent random potential at interfaces and band matching mismatching between magnetic and nonmagnetic layers For TMR several factors are shown to be important in determining the MR ratio including the shape of the Fermi surface of the electrodes the symmetry of the wave functions electron scattering at interfaces and spin slip tunneling An interpretation of TMR in Fe MgO Fe and of an oscillation of TMR is presented TMR in granular films and in the Coulomb blockade regime is also described We also provide a brief explanation for other MR effects such as normal MR anisotropic MR AMR and colossal MR CMR in order to clarify the essential difference between these MRs and GMR TMR and BMR These MR effects are attributed to the spin dependent electrical currents produced in metallic ferromagnets After the discovery of these different MR effects the role of spin current was proposed for example spin Hall effect and the effects of spin transfer torque which will be briefly explained in this chapter The former originates from the spin orbit interaction and can be observed even in nonmagnetic metals and semiconductors It is closely related to the anomalous Hall effect observed in ferromagnetic metals The spin transfer torque is an inverse effect of the MR The MR is the resistivity change produced by magnetization rotation in ferromagnetic junctions while the spin transfer torque is an effect in which spin polarized current makes the magnetization rotate Finally we briefly introduce the coupled effects of spin charge and heat transport which are called spin caloritronics
