Abstract. The overview covers selected topics on magnetic dichroism in atomic core level photoemission: the geometrical model in photoionization of laser polarized atoms and its generalization, contributions to the complete experiment from magnetic dichroism studies and nondipole effects in magnetic dichroism.

1 Introduction

The term ‘dichroism’ is generally used to reflect the dependence of photon interaction with a material on the polarization of the photon and on the anisotropy of the material. One speaks about ‘magnetic’ dichroism (MD) when its origin is in the latter. The MD with circularly and linearly polarized radiation is called circular magnetic dichroism (CMD) and linear magnetic dichroism (LMD), respectively. A rapid progress in the VUV and X-ray CMD and LMD studies was stimulated by the advent of new high-brilliance synchrotron radiation (SR) sources with controlled variable polarization. In solids and nanoobjects, MD in photoabsorption near the core level ionization thresholds, accompanied by remarkable theoretical developments, provides valuable information on the element-specific magnetic structure and has become a magnetometry tool (e.g. [1–3] and references therein). In the photoionization region, new aspects of the MD come up associated with a new degree of freedom, namely the escape direction of the photoelectron. Besides, in contrast to photoabsorption, the final wave function is a scattering state, leading to complex amplitudes with non-zero relative phases. These two important points increase the potential of the MD method, in particular an analysis of the CMD and LMD in the angular distribution of the photoelectrons (CMDAD and LMDAD, respectively) becomes possible (e.g. [4–7] and references therein).

Another class of VUV and X-ray MD studies deals with atoms in the gas phase. In practice, the target atom polarization, which is an analogue of magnetization in solid materials, can be induced by photoabsorption, optical laser pumping, or an inhomogeneous external magnetic field. Photoionization of the polarized atoms is an important tool to investigate subtle details of the photoionization dynamics, reaching the stage of a complete quantum mechanical experiment. From another side, as a consequence of the localized character of the core electrons, the atomic picture of core level photoemission can serve as a reasonable first approximation for the photoemission from solid samples and films. Comparison of photoemission from atoms and condensed materials open an access to separate intra-atomic and interatomic effects in the spectra of bound atoms.

The combination of optical laser pumping and intense SR resulted in a breakthrough in investigations of MD in gaseous atomic targets [8–11]. High intensity of the SR permits to decrease the atomic density in the reaction volume and therefore to avoid collisions and radiation trapping, which destroy the target polarization. Furthermore, the energy resolution improved

Magnetic Dichroism In Corelevel Photoemission:

Magnetic Dichroism in Core-Level Photoemission Kai Starke, 2013-10-03 The book is a review of a rapidly developing field in thin film magnetism Between 1990 when magnetic dichroism in core level photoemission MDPE was discovered and today the attitude of scientists in the field has changed from surprise to a full appreciation of the physical basis Special emphasis is laid on the application of MDPE as an element specific magnetization probe for two dimensional rare earth systems

Core Level Spectroscopies for Magnetic Phenomena Paul S. Bagus, Gianfranco Pacchioni, Fulvio Parmigiani, 2013-11-11 For several years core level spectroscopies and other closely related electron spectroscopies have provided very useful information about the atomic composition the geometric structure and the electronic structure of condensed matter Recently these spectroscopies have also been used for the study of magnetic properties such studies have a great potential to extend our knowledge and understanding of magnetic systems This volume collects the lectures presented at the NATO Advanced Study Institute on Core Level Spectroscopies for Magnetic Phenomena Theory and Experiment held at the Ettore Majorana Centre Erice Sicily on 15 to 26 May 1994 The topics considered at the ASI covered a wide range of subjects involving the use of core level and related spectroscopies to study magnetic phenomena There are a large and growing number of applications of these spectroscopies to the study of magnetic materials an important objective of the ASI was to stimulate further growth The topics covered at the ASI can be placed into three general groups 1 fundamental principles of core level spectroscopies 2 basic aspects of magnetic phenomena and 3 the combination of the two previous topics embodied in applications of the spectroscopies to magnetism In all three groups theoretical interpretations as well as experimental measurements were presented often both of these aspects were covered in a single lecture or series of lectures The theoretical treatments of the spectroscopies as well as of the magnetic phenomena help to establish a framework for understanding many of the experimental measurements on magnetic materials

Angle and Temperature Dependence of Magnetic Circular Dichroism in Core-level Photoemission from Gd(0001)., 1997 Magnetic dichroism in core level photoelectron emission from solids represents a promising new element specific probe of surface and interface atomic structure and magnetic order One way of measuring such effects is by using photoelectrons excited by circular polarized radiation thus leading to magnetic circular dichroism MCD if the intensity with right circular polarized RCP light is not equal to that with left circular polarized LCP light The spin integrated photoelectron intensity in a certain emission direction also in general depends on the direction of the magnetization in a magnetic material In fact if the magnetization lies in a surface mirror plane then inverting its direction can provide a second way of measuring MCD Purely atomic theoretical models have been successful in explaining many aspects of such data By varying the emission direction one also probes the geometric structure of the sample But such MCD in photoelectron angular distributions MCDAD then has to be interpreted also in terms of photoelectron diffraction Measuring the temperature dependence of such MCD effects also provides a useful tool for

studying magnetic transition temperatures The authors have here studied such effects in core level emission from Gd 0001

such properties as catalysis microelectronic devices and contacts wear lubrication resistance to corrosion ductility creep intragranular fracture toughness and strength of steels adhesion of protective oxide scales and the mechanical properties of ceramics one must address a rather complex problem involving a number of fundamental parameters the atomic and electronic structure the energy and chemistry of surface and interface regions diffusion along and across interfaces and the response of an interface to stress The intense need to gain an understanding of the properties of surfaces and interfaces is amply attested to by the large number of conferences and workshops held on surface and interface science Because of this need the fields of surface and interface science have been established in their own right although their development presently lags behind that of general materials science associated with bulk translationally invariant systems There are good reasons to expect this situation to change rather dramatically in the next few years Existing techniques for investigating surfaces and interfaces have reached maturity and are increasingly being applied to systems of practical relevance New techniques are still being created which drastically widen the scope of applicability of surface and interface studies On the experimental side new microscopies are bearing fruit
