materials including ferroics perovskites multiferroics CMR and high temperature superconductors The common theme is the existence of many competing ground states and frustration as a collusion of spin charge orbital and lattice degrees of freedom in the presence of disorder and both dipolar and elastic long range forces An important consequence of the complex unit cell and the competing interactions is that the emergent materials properties are very sensitive to external fields thus rendering these materials with highly desirable technologically important applications enabled by cross response

incomplete it was limited either to the 3D spatial structure or to the 1D temporal evolution However in systems with myriads of atoms 4D spatiotemporal visualization is essential for dissecting their complexity The biological world is rich with examples and many molecular diseases cannot be fully understood without such direct visualization as for example in the case of Alzheimer s and Parkinson s The same is true for phenomena in materials science chemistry and nanoscience This anthology is an account of the collected works that have emerged over the past decade from Caltech Through recent publications the volume provides overviews of the principles the electron based techniques and the applications made Thanks to advances in imaging principles and technology it is now possible with 4D electron microscopy to reach ten orders of magnitude improvement in time resolution while simultaneously conserving the atomic spatial resolution in visualization This is certainly a long way from Robert Hooke s microscopy which was recorded in his 1665 masterpiece Micrographia
