Ivancevic,Tijana T. Ivancevic,2006-09-10 Geometrical Dynamics of Complex Systems is a graduate level monographic textbook Itrepresentsacomprehensiveintroductionintorigorousgeometrical dynamicsofcomplexsystemsofvariousnatures By complexsystems inthis book are meant high dimensional nonlinear systems which can be but not necessarily are adaptive This monograph proposes a uni ed geometrical proachtodynamicsofcomplexsystemsofvariouskinds engineering physical biophysical psychophysical sociophysical econophysical etc As their names suggest all these multi input multi output MIMO systems have something in common the underlying physics However instead of dealing with the pop 1 ular soft complexity philosophy we rather propose a rigorous geometrical and topological approach We believe that our rigorous approach has much greater predictive power than the soft one We argue that science and te nology is all about prediction and control Observation understanding and explanation are important in education at undergraduate level but after that it should be all prediction and control The main objective of this book is to show that high dimensional nonlinear systems and processes of real life can be modelled and analyzed using rigorous mathematics which enables their complete predictability and controllability as if they were linear systems It is well known that linear systems which are completely predictable and controllable by de nition live only in Euclidean spaces of various mensions They are as simple as possible mathematically elegant and fully elaborated from either scienti c or engineering side However in nature no ing is linear In reality everything has a certain degree of nonlinearity which means unpredictability with subsequent uncontrollability   **The Theory of**

Nonlinear Systems Bo Yang,Dusan Stipanovic,2023-03-15 In mathematics and science a nonlinear system is a system in which the change of the output is not proportional to the change of input Nonlinear control systems which are among the new technologies most widely used in many fields such as economic management industrial production technology research and development ecological prevention and control are at the core of worldwide automation control technology In contrast to linear control systems the nonlinear control system has the characteristics of a data model stability zero input system response self excited oscillation or limit cycle and a more complex structure increasing the difficulty of its theoretical analysis and technical development Nonlinear systems are common phenomena in real life and as such cannot be ignored Analysis and research of nonlinear systems are therefore important and researchers need to clarify their characteristics explore scientific and effective application measures and finally enhance their control quality This book comprehensively investigates the main principles core mechanisms typical problems and relevant solutions involved in nonlinear systems In

general this book aims to provide advanced research on nonlinear systems and control schemes for researchers and engineers working in related fields and thus promote future study in this research area   *Cognitive Science* Harald Maurer,2021-07-08 The Mind and Brain are usually considered as one and the same nonlinear complex dynamical system in which information processing can be described with vector and tensor transformations and with attractors in multidimensional state spaces Thus an internal neurocognitive representation concept consists of a dynamical process which filters out statistical prototypes from the sensorial information in terms of coherent and adaptive n dimensional vector fields These prototypes serve as a basis for dynamic probabilistic predictions or probabilistic hypotheses on prospective new data see the recently introduced approach of predictive coding in neurophilosophy Furthermore the phenomenon of sensory and language cognition would thus be based on a multitude of self regulatory complex dynamics of synchronous self organization mechanisms in other words an emergent flux equilibrium process steady state of the total collective and coherent neural activity resulting from the oscillatory actions of neuronal assemblies In perception it is shown how sensory object informations like the object color or the object form can be dynamically related together or can be integrated to a neurally based representation of this perceptual object by means of a synchronization mechanism feature binding In language processing it is shown how semantic concepts and syntactic roles can be dynamically related together or can be integrated to neurally based systematic and compositional connectionist representations by means of a synchronization mechanism variable binding solving the Fodor Pylyshyn Challenge Since the systemtheoretical connectionism has succeeded in modeling the sensory objects in perception as well as systematic and compositional representations in language processing with this vector and oscillation based representation format a new convincing theory of neurocognition has been developed which bridges the neuronal and the cognitive analysis level The book describes how elementary neuronal information is combined in perception and language so it becomes clear how the brain processes this information to enable basic cognitive performance of the humans
