Noncommutative Geometry, Quantum Fields and Motives Alain Connes, Matilde Marcolli, 2019-03-13 The unifying theme of this book is the interplay among noncommutative geometry physics and number theory The two main objects of investigation are spaces where both the noncommutative and the motivic aspects come to play a role space time

where the guiding principle is the problem of developing a quantum theory of gravity and the space of primes where one can regard the Riemann Hypothesis as a long standing problem motivating the development of new geometric tools The book stresses the relevance of noncommutative geometry in dealing with these two spaces The first part of the book deals with quantum field theory and the geometric structure of renormalization as a Riemann Hilbert correspondence It also presents a model of elementary particle physics based on noncommutative geometry The main result is a complete derivation of the full Standard Model Lagrangian from a very simple mathematical input Other topics covered in the first part of the book are a noncommutative geometry model of dimensional regularization and its role in anomaly computations and a brief introduction to motives and their conjectural relation to quantum field theory The second part of the book gives an interpretation of the Weil explicit formula as a trace formula and a spectral realization of the zeros of the Riemann zeta function This is based on the noncommutative geometry of the ad le class space which is also described as the space of commensurability classes of  $\mathbb{Q}$  lattices and is dual to a noncommutative motive endomotive whose cyclic homology provides a general setting for spectral realizations of zeros of  $L$  functions The quantum statistical mechanics of the space of  $\mathbb{Q}$  lattices in one and two dimensions exhibits spontaneous symmetry breaking In the low temperature regime the equilibrium states of the corresponding systems are related to points of classical moduli spaces and the symmetries to the class field theory of the field of rational numbers and of imaginary quadratic fields as well as to the automorphisms of the field of modular functions The book ends with a set of analogies between the noncommutative geometries underlying the mathematical formulation of the Standard Model minimally coupled to gravity and the moduli spaces of  $\mathbb{Q}$  lattices used in the study of the zeta function

Engineering Applications of Noncommutative Harmonic Analysis Gregory S. Chirikjian, Alexander B. Kyatkin, 2021-02-25 First published in 2001 The classical Fourier transform is one of the most widely used mathematical tools in engineering However few engineers know that extensions of harmonic analysis to functions on groups holds great potential for solving problems in robotics image analysis mechanics and other areas For those that may be aware of its potential value there is still no place they can turn to for a clear presentation of the background they need to apply the concept to engineering problems Engineering Applications of Noncommutative Harmonic Analysis brings this powerful tool to the engineering world Written specifically for engineers and computer scientists it offers a practical treatment of harmonic

analysis in the context of particular Lie groups rotation and Euclidean motion It presents only a limited number of proofs focusing instead on providing a review of the fundamental mathematical results unknown to most engineers and detailed discussions of specific applications Advances in pure mathematics can lead to very tangible advances in engineering but only if they are available and accessible to engineers Engineering Applications of Noncommutative Harmonic Analysis provides the means for adding this valuable and effective technique to the engineer's toolbox **Pseudo-Differential Equations**

*and Independence: Permutation Invariant Random Matrices and the Three Notions of Independence* Camille Male, 2021-02-10 Voiculescu's notion of asymptotic free independence is known for a large class of random matrices including independent unitary invariant matrices This notion is extended for independent random matrices invariant in law by conjugation by permutation matrices This fact leads naturally to an extension of free probability formalized under the

notions of traffic probability The author first establishes this construction for random matrices and then defines the traffic distribution of random matrices which is richer than the distribution of free probability The knowledge of the individual traffic distributions of independent permutation invariant families of matrices is sufficient to compute the limiting distribution of the join family Under a factorization assumption the author calls traffic independence the asymptotic rule that plays the role of independence with respect to traffic distributions Wigner matrices Haar unitary matrices and uniform permutation matrices converge in traffic distributions a fact which yields new results on the limiting distributions of several matrices the author can construct from them Then the author defines the abstract traffic spaces as non commutative probability spaces with more structure She proves that at an algebraic level traffic independence in some sense unifies the three canonical notions of tensor free and Boolean independence A central limiting theorem is stated in this context interpolating between the tensor free and Boolean central limit theorems
