Transitions in Lattice Models Joaquin Marro,Ronald Dickman,2005-09-08 This book provides an introduction to nonequilibrium statistical physics via lattice models Beginning with an introduction to the basic driven lattice gas the early chapters discuss the relevance of this lattice model to certain natural phenomena examining simulation results in detail Later chapters discuss absorbing state transitions and examine a variety of systems subject to dynamic disorder The book discusses the effects of multiparticle rules nonunique absorbing states and conservation laws as well as the use of methods such as mean field theory Monte Carlo simulation and the concept of universality It also includes detailed references and examples using simple representations of nature to describe real systems Non-Equilibrium Phase Transitions Malte Henkel,Haye Hinrichsen,Sven Lübeck,2008-11-27 This book describes two main classes of non equilibrium phase transitions static and dynamics of transitions into an absorbing state and dynamical scaling in far from equilibrium relaxation behavior and ageing **Absorbing State Transitions in Clean and Disordered Lattice Models** Man Young Lee,2011

Nonequilibrium systems can undergo continuous phase transitions between different steady states These transitions are characterized by collective fluctuations over large distances and long times similar to the behavior of equilibrium critical points They also can be divided into different universality classes according to their critical behavior This dissertation considers two types of nonequilibrium transitions First study concerns absorbing state transitions on a randomly diluted lattice Second study deals with nonequilibrium models with several absorbing states We investigate two specific nonequilibrium lattice models i e the contact process and the generalized contact process by means of both theoretical and computational approaches In section 1 we introduce the basic arguments and theories to support our investigations for both problems In sections 2 and 3 we investigate nonequilibrium phase transitions of the contact process and the generalized contact process on a percolating lattice focusing on the transition across the lattice percolation threshold In this study we show that the interplay between geometric criticality due to percolation and dynamical fluctuations of the nonequilibrium system leads to a new universality class The critical point is characterized by ultra slow activated dynamical scaling and accompanied by strong Griffiths singularities We support our theory by extensive Monte Carlo simulations In sections 4 and 5

we investigate the generalized contact process on one and two dimensional lattices We treat the creation rate of active sites between inactive domains as an independent parameter It turns out that this model has an unusual phase diagram with two different nonequilibrium phase transitions The special point separating them shares some characteristics with a multicritical point For one dimension a small boundary rate takes the system from the directed percolation universality class to the parity conserved class For two dimensions the critical behavior on the generic transition line is of mean field type with logarithmic corrections suggesting that the two dimensional generalized contact process is in the generalized voter universality class

Abstract leaf iv *Nonequilibrium Statistical Physics* Roberto Livi, Paolo Politi, 2017-10-05 A comprehensive and pedagogical text on nonequilibrium statistical physics covering topics from random walks to pattern formation [Lattice Models for Fluctuating Hydrodynamics in Granular and Active Matter](#) Alessandro Manacorda, 2018-07-28 This book investigates the common nature of granular and active systems which is rooted in their intrinsic out of equilibrium behavior with the aim of finding minimal models able to reproduce and predict the complex collective behavior observed in experiments and simulations Granular and active matter are among the most studied systems in out of equilibrium statistical physics The book guides readers through the derivation of a fluctuating hydrodynamic description of granular and active matter by means of controlled and transparent mathematical assumptions made on a lattice model It also shows how a macroscopic description can be provided from microscopic requirements leading to the prediction of collective states such as cooling swarming clustering and the transitions among them The analytical and numerical results shed new light on the physical connection between the local microscopic properties of few particles and the macroscopic collective motion of the whole system

Phase Transitions and Surface Growth in Nonequilibrium Lattice Models Thomas Michael Martynec, 2021 **Field Theory of Non-Equilibrium Systems** Alex Kamenev, 2023-01-05 The physics of non equilibrium many body systems is a rapidly expanding area of theoretical physics Traditionally employed in laser physics and superconducting kinetics these techniques have more recently found applications in the dynamics of cold atomic gases mesoscopic and nano mechanical systems and quantum computation This book provides a detailed presentation of modern non equilibrium field theoretical methods applied to examples ranging from biophysics to the kinetics of superfluids and superconductors A highly pedagogical and self contained approach is adopted within the text making it ideal as a reference for graduate students and researchers in condensed matter physics In this Second Edition the text has been substantially updated to include recent developments in the field such as driven dissipative quantum systems kinetics of fermions with Berry curvature and Floquet kinetics of periodically driven systems among many other important new topics Problems have been added throughout structured as compact guided research projects that encourage independent exploration **Parallel Algorithms and Cluster Computing** Karl Heinz Hoffmann, Arnd Meyer, 2007-06-24

Highperformancecomputinghaschangedthewayinwhichscienceprogresses During the last 20 years the increase in computing

power the development of effective algorithms and the application of these tools in the area of physics and engineering has been decisive in the advancement of our technological world. These abilities have allowed to treat problems with a complexity which had been out of reach for analytical approaches. While the increase in performance of single processes has been immense, the increase of massive parallel computing as well as the advent of cluster computers has opened up the possibilities to study realistic systems. This book presents major advances in high performance computing as well as major advances due to high performance computing. The progress made during the last decade rests on the achievements in three distinct science areas. Open and pressing problems in physics and mechanical engineering are the driving force behind the development of new tools and new approaches in these science areas. The treatment of complex physical systems with frustration and disorder, the analysis of the elastic and non elastic movement of solids as well as the analysis of coupled fluid systems pose problems which are open to a numerical analysis only with state of the art computing power and algorithms. The desire of scientific accuracy and quantitative precision leads to an enormous demand in computing power. Asking the right questions in these areas lead to new insights which have not been available due to other means like experimental measurements. Thesecondareawhichisdecisiveforeffectivehighperformancecomputing is a realm of effective algorithms.

Self-Organized Criticality, Three Decades Later Subhrangshu Sekhar Manna, Attilio L. Stella, Peter Grassberger, Ronald Dickman, 2022-01-28 Phase Transitions Ricard Solé, 2011-07-25 Phase transitions changes between different states of organization in a complex system have long helped to explain physics concepts such as why water freezes into a solid or boils to become a gas. How might phase transitions shed light on important problems in biological and ecological complex systems? Exploring the origins and implications of sudden changes in nature and society, *Phase Transitions* examines different dynamical behaviors in a broad range of complex systems. Using a compelling set of examples from gene networks and ant colonies to human language and the degradation of diverse ecosystems, the book illustrates the power of simple models to reveal how phase transitions occur. Introductory chapters provide the critical concepts and the simplest mathematical techniques required to study phase transitions. In a series of example driven chapters, Ricard Sol shows how such concepts and techniques can be applied to the analysis and prediction of complex system behavior including the origins of life, viral replication, epidemics, language evolution and the emergence and breakdown of societies. Written at an undergraduate mathematical level, this book provides the essential theoretical tools and foundations required to develop basic models to explain collective phase transitions for a wide variety of ecosystems.

Traffic and Granular Flow ' 05 Andreas Schadschneider, Thorsten Pöschel, Reinhart Kühne, Michael Schreckenberg, Dietrich E. Wolf, 2007-04-20 This book again continues the biannual series of now six conference proceedings which has become a classical reference in traffic and granular research alike. It addresses new developments at the borderline between physics, engineering and computational science. Complex systems where many simple agents be it vehicles or particles give rise to surprising and fascinating
