### ABSTRACT

This paper discusses in detail, two techniques for the analysis of non-linear electronic circuit. The first technique is an automated version of the traditional time domain solution method (Transient Analysis). For a given circuit topology the state equations are generated by computer and solved numerically. The second technique involves the use of a hybrid time-frequency domain approach and is known as harmonic balance (Steady State Analysis). The formulation and solution methods adopted for both methods are outlined in detail. Emphasis is placed throughout an application to microwave circuits. In order to illustrate the properties of each method, sample analyses for two main circuits are given. The first circuit is that of a linear amplifier operating at 12 GHz and driven into saturation. The second circuit is that of a nonlinear frequency doubler, doubling from 7-14 GHz. Some advanced applications are discussed in order to further highlight the relative advantages and disadvantages of each technique. Finally it is shown how a non-linear CAD package can be produced which allows circuit optimization in a similar way to that allowed by linear CAD programs. Some remaining problems which need more investigations and possible future work are highlighted.

## 1. INTRODUCTION

The requirement for computer tools that are sufficiently accurate to allow the design of active microwave circuits to obey given specifications is increasingly important. In the past the design of microwave circuits has been the subject of empiricist post-manufacture tuning. However the ever increasing use of microwave monolithic circuits, highly accurate circuits simulators are essential. A large class of active monolithic microwave circuits operate in the nonlinear regime. These circuits, which include amplifiers, oscillators, frequency multipliers and mixers may be efficiently designed using nonlinear tools.

This paper addresses two of the most frequently used simulation techniques for active microwave circuits. The first technique uses traditional time domain method based on the solution of state-space variables. The second technique, based on hybrid frequency-time domain analysis, is known as the harmonic balance method. The formulation of the time domain approach encompasses many advanced features including the automatic generation of the state variables for any given circuit topology including these with distributed transmission line elements. Included also is a self-tuning integration routine used to obtain rapid and stable convergence. Fourier analysis is employed to give the harmonic information necessary for many

**Nonlinear Active Microwave Circuits** T. Berceli, 1987 This book presents analysis and design methods of microwave nonlinear active circuits Nonlinear models are established for each individual device thus introducing a set of nonlinear building blocks This allows not only qualitative but also quantitative investigations The relationships thereby obtained can be used for design purposes and they are also a help in understanding the circuit operation and for the detailed investigation of oscillators amplifiers mixers frequency multipliers and dividers The book concentrates on problems arising from the active nonlinear elements and it is mostly nonlinear transmission properties that are investigated Normalized quantities are applied in order to obtain results that can be used generally for a wide range of applications Equations are derived for many important circuit characteristics such as bandwidth gain amplitude and phase response group delay time AM compression AM to PM conversion noise figure AM noise FM noise output power added power efficiency matching optimum adjustment stability dynamic properties The results are directly applicable in the design procedure of circuits

*Digital Control of Electric Drives* R. Koziol, J. Sawicki, L. Szklarski, 2013-10-22 The electromechanical systems employed in different branches of industry are utilized most often as drives of working machines which must be fed with electric energy in a continuous periodic or even discrete way Some of these machines operate at constant speed others require wide and varying energy control In many designs the synchronous cooperation of several electric drives is required in addition to the desired dynamic properties For these reasons the control of the cooperation and dynamics of electromechanical systems requires the use of computers This book adopts an unusual approach to the subject in that it treats the electric drive system on the one hand as an element of a control system and on the other as an element of a complex automatic system These two trends in the development of the automatic control of electric drives have resulted in a volume that provides a thorough overview on the variety of different approaches to the design of control systems

**Microwave Measurement by Comparison Methods** Ivan Kneppo, 1988 This book is devoted to the problems of measuring electrical parameters of microwave devices circuits and systems by comparing the measured values of a quantity with known values of the quantity as represented by a reference microwave standard The author has tried to cover quite a wide group of microwave measuring techniques in the study since up to now comparison measurements have appeared only in periodicals handbooks of microwave measuring techniques or in various manuals describing the standard measuring procedures This broad based approach offers the possibility of abstracting the principles which are common to all partial comparison techniques and their modifications as well as deriving the general rules for the optimum design set up and use of corresponding measurement networks

**Symbolic Network Analysis** Pen-Min Lin, 1991 The value of symbolic network analysis is now well recognized In industry it has been used as an aid in the design of small linear networks In academic institutions it has been found useful as an instructional aid The purpose of this book is to present in a single volume a unified treatment of all symbolic analysis methods using a consistent
