**Nonlinear Astrophysical Fluid Dynamics** J. Robert Buchler, Stephen T. Gottesman, 1990      Fundamentals of Astrophysical Fluid Dynamics Shoji Kato, Jun Fukue, 2020-06-19 This book offers an overview of the fundamental dynamical processes which are necessary to understand astrophysical phenomena from the viewpoint of hydrodynamics magnetohydrodynamics and radiation hydrodynamics The book consists of three parts The first discusses the fundamentals of hydrodynamics necessary to understand the dynamics of astrophysical objects such as stars interstellar gases and accretion disks The second part reviews the interactions between gases and magnetic fields on fluid motions the magnetohydrodynamics highlighting the important role of magnetic fields in dynamical phenomena under astrophysical environments The third part focuses on radiation hydrodynamics introducing the hydrodynamic phenomena characterized by the coupling of radiation and gas motions and further on relativistic radiation hydrodynamics Intended as a pedagogical introduction for advanced undergraduate and graduate students it also provides comprehensive coverage of the fundamentals of astrophysical fluid dynamics making it an effective resource not only for graduate courses but also for beginners wanting to learn about hydrodynamics magnetohydrodynamics and radiation hydrodynamics in astrophysics independently      *An Introduction to Astrophysical Fluid Dynamics* Michael J. Thompson, 2006 This book provides an introduction for graduate students and advanced undergraduate students to the field of astrophysical fluid dynamics Although sometimes ignored fluid dynamical processes play a central role in virtually all areas of astrophysics No previous knowledge of fluid dynamics is assumed After establishing the basic equations of fluid dynamics and the physics relevant to an astrophysical application a variety of topics in the field are addressed There is also a chapter introducing the reader to numerical methods Appendices list useful physical constants and astronomical quantities and provide handy reference material on Cartesian tensors vector calculus in polar coordinates self adjoint eigenvalue problems and JWKB theory      *The Numerical Modelling of Nonlinear Stellar Pulsations* J. Robert Buchler, 2012-12-06 This interdisciplinary meeting has brought together a group of astrophysicists with hands on experience in the numerical computation of astrophysical fluid dynamics in particular nonlinear stellar pulsations and a group of applied mathematicians who are actively engaged with the development of novel and improved numerical methods The goal of the workshop has been for the astrophysicists to discuss in detail the numerical problems encountered in the modelling of stellar pulsations and for the mathematicians to present a survey of recent developments in numerical techniques This astrophysical mathematical intercourse will help the astrophysicists in the future development of more reliable and efficient codes on the one hand and it has introduced the mathematicians to an unfamiliar area which is a tough testing ground for their techniques Since the difficulties encountered are common to other fluid dynamics problems and are in fact perhaps more severe fluid dynamicists in other research areas may find the results of this workshop of interest as well Much of our theoretical understanding of the intricate and interesting behavior of variable

stars rests on our ability to perform accurate numerical hydrodynamical computations of stellar models Extensive calculations of nonlinear radial stellar pulsations with the use of increasingly powerful computers are showing more and more clearly that the numerical codes in current use have serious deficiencies      Stellar Astrophysical Fluid Dynamics Michael J. Thompson, Jørgen Christensen-Dalsgaard, 2003-05-01 In all phases of the life of a star hydrodynamical processes play a major role This volume gives a comprehensive overview of the state of knowledge in stellar astrophysical fluid dynamics and its publication marked the 60th birthday of Douglas Gough Professor of Theoretical Physics at the University of Cambridge and leading contributor to stellar astrophysical fluid dynamics Topics include properties of pulsating stars helioseismology convection and mixing in stellar interiors dynamics of stellar rotation planet formation and the generation of stellar and planetary magnetic fields Each chapter is written by leading experts in the field and the book provides an overview that is central to any attempt to understand the properties of stars and their evolution With extensive references to the technical literature this is a valuable text for researchers and graduate students in stellar astrophysics      **Fluid Dynamics and Dynamos in Astrophysics and Geophysics** Andrew M. Soward, Christopher A. Jones, David W. Hughes, Nigel O. Weiss, 2005-03-16 The increasing power of computer resources along with great improvements in observational data in recent years have led to some remarkable and rapid advances in astrophysical fluid dynamics The subject spans three distinct but overlapping communities whose interests focus on 1 accretion discs and high energy astrophysics 2 solar stellar and      Statistical Challenges in Modern Astronomy Eric D. Feigelson, G. Jogesh Babu, 2012-12-06 Modern astronomy has been characterized by an enormous growth in data acquisition from new technologies in telescopes detectors and computation One can now compile catalogs of tens or hundreds of millions of stars or galaxies and databases from satellite based observations are reaching terabit proportions This wealth of data gives rise to statistical challenges not previously encountered in astronomy This book is the result of a workshop held at Pennsylvania State University in August 1991 that brought together leading astronomers and statisticians to consider statistical challenges encountered in modern astronomical research The chapters have all been thoroughly revised in the light of the discussions at the conference and some of the lively discussion is recorded here as well      **Chaos and Complexity in Astrophysics** O. Regev, 2006-03-23 A primer for researchers and graduate students introduces and applies chaos techniques to specific astrophysical systems      **Astrophysical Jets** D. Burgarella, M. Livio, C. P. O'Dea, 1993-11-11 A collection of edited review articles presented at a workshop at the Space Telescope Science Institute which gathered astrophysicists from the fields of extragalactic and galactic stellar jets      **Hydrodynamic Instability and Transition to Turbulence** Akiva M. Yaglom, 2012-12-18 This book is a complete revision of the part of Monin Yaglom's famous two volume work Statistical Fluid Mechanics Mechanics of Turbulence that deals with the theory of laminar flow instability and transition to turbulence It includes the considerable advances in the subject that have been made in the last 15 years or so It is intended as a textbook for advanced graduate

courses and as a reference for research students and professional research workers The first two Chapters are an introduction to the mathematics and the experimental results for the instability of laminar or inviscid flows to infinitesimal in practice small disturbances The third Chapter develops this linear theory in more detail and describes its application to particular problems Chapters 4 and 5 deal with instability to finite amplitude disturbances much of the material has previously been available only in research papers

Cosmic Winds and the Heliosphere J. R. Jokipii, C. P. Sonett, Mark S. Giampapa, 2018-01-30 Until the advent of space physics astrophysical plasmas could be studied only using ground based observations Although observational methods have advanced over recent decades the merging of heliospheric physics with astrophysics is far from complete due to the vastly different techniques employed by astronomers and space physicists That astrophysical plasmas can be studied directly is a major advance in astrophysical research The solar wind from the Sun is only one of many examples of solar winds but it provides scientists with a basis for understanding how these formerly disparate disciplines are related Cosmic Winds and the Heliosphere is a comprehensive sourcebook on conceptually correlated topics in astrophysical winds and heliospheric physics The contributors review the various kinds of winds such as solar wind winds of cataclysmic variables and winds from pulsating stars They then examine the physics of wind origin and physical phenomena in winds including heliospheric shocks magnetohydrodynamic turbulence and kinetic phenomena A final section considers interactions with surrounding media with contributions ranging from studies of the interstellar cloud surrounding the solar system to considerations of solar wind interaction with comets Prepared to the scrupulous standards of the University of Arizona Space Science Series Cosmic Winds and the Heliosphere is an essential volume for astronomers and space physicists

*Modern Plasma Physics: Volume 1, Physical Kinetics of Turbulent Plasmas* Patrick H. Diamond, Sanae-I. Itoh, Kimitaka Itoh, 2010-06-17 This three volume series presents the ideas models and approaches essential to understanding plasma dynamics and self organization for researchers and graduate students in plasma physics controlled fusion and related fields such as plasma astrophysics Volume I develops the physical kinetics of plasma turbulence through a focus on quasi particle models and dynamics It discusses the essential physics concepts and theoretical methods for describing weak and strong fluid and phase space turbulence in plasma systems far from equilibrium The book connects the traditionally plasma topic of weak or wave turbulence theory to more familiar fluid turbulence theory and extends both to the realm of collisionless phase space turbulence This gives readers a deeper understanding of these related fields and builds a foundation for future applications to multi scale processes of self organization in tokamaks and other confined plasmas This book emphasizes the conceptual foundations and physical intuition underpinnings of plasma turbulence theory

Committee,1983-02-01      **Ten Chapters in Turbulence** Peter A. Davidson,Yukio Kaneda,Katepalli R. Sreenivasan,2012-12-06 Turbulence is ubiquitous in science technology and daily life and yet despite years of research our understanding of its fundamental nature is still tentative and incomplete More generally the tools required for a deep understanding of strongly interacting many body systems remain underdeveloped Inspired by a research programme held at the Newton Institute in Cambridge this book contains reviews by leading experts that summarize our current understanding of the nature of turbulence from theoretical experimental observational and computational points of view The articles cover a wide range of topics including the scaling and organized motion in wall turbulence small scale structure dynamics and statistics of homogeneous turbulence turbulent transport and mixing and effects of rotation stratification and magnetohydrodynamics as well as superfluidity The book will be useful to researchers and graduate students interested in the fundamental nature of turbulence at high Reynolds numbers      **Stellar Astrophysics** Roger John Tayler,1992 Stellar Astrophysics contains a selection of high quality papers that illustrate the progress made in research into the structure and evolution of stars Senior undergraduates graduates and researchers can now be brought thoroughly up to date in this exciting and ever developing branch of astronomy      Computational Methods for Astrophysical Fluid Flow Randall J. LeVeque,Dimitri Mihalas,E.A. Dorfi,Ewald Müller,2006-04-18 This book leads directly to the most modern numerical techniques for compressible fluid flow with special consideration given to astrophysical applications Emphasis is put on high resolution shock capturing finite volume schemes based on Riemann solvers The applications of such schemes in particular the PPM method are given and include large scale simulations of supernova explosions by core collapse and thermonuclear burning and astrophysical jets Parts two and three treat radiation hydrodynamics The power of adaptive moving grids is demonstrated with a number of stellar physical simulations showing very crispy shock front structures      *Applied Mechanics Reviews* ,1979      Solar Interior and Atmosphere Arthur N.
