## **Nonlinear Optimization With Financial Applications:**

**Nonlinear Optimization with Financial Applications** Michael Bartholomew-Biggs, 2006-07-21 The book introduces the key ideas behind practical nonlinear optimization Computational finance an increasingly popular area of mathematics degree programs is combined here with the study of an important class of numerical techniques The financial content of the book is designed to be relevant and interesting to specialists However this material which occupies about one third of the text is also sufficiently accessible to allow the book to be used on optimization courses of a more general nature The essentials of most currently popular algorithms are described and their performance is demonstrated on a range of optimization problems arising in financial mathematics Theoretical convergence properties of methods are stated and formal proofs are provided in enough cases to be instructive rather than overwhelming Practical behavior of methods is illustrated by computational examples and discussions of efficiency accuracy and computational costs Supporting software for the examples and exercises is available but the text does not require the reader to use or understand these particular codes The author has been active in optimization for over thirty years in algorithm development and application and in teaching and research supervision

*Nonlinear Optimization with Engineering Applications* Michael Bartholomew-Biggs, 2008-12-16 This book like its companion volume *Nonlinear Optimization with Financial Applications* is an outgrowth of undergraduate and postgraduate courses given at the University of Hertfordshire and the University of Bergamo It deals with the theory behind numerical methods for nonlinear optimization and their application to a range of problems in science and engineering The book is intended for final year undergraduate students in mathematics or other subjects with a high mathematical or computational content and exercises are provided at the end of most sections The material should also be useful for postgraduate students and other researchers and practitioners who may be concerned with the development or use of optimization algorithms It is assumed that readers have an understanding of the algebra of matrices and vectors and of the Taylor and mean value theorems in several variables Prior experience of using computational techniques for solving systems of linear equations is also desirable as is familiarity with the behaviour of iterative algorithms such as Newton's method for nonlinear equations in one variable Most of the currently popular methods for continuous nonlinear optimization are described and given at least an intuitive justification Relevant convergence results are also outlined and we provide proofs of these when it seems instructive to do so This theoretical material is complemented by numerical illustrations which give a flavour of how the methods perform in practice
