Radar Scattering from Modulated Wind Waves G.J. Komen, W.A. Oost, 2012-12-06 Ten years ago de Loor and co workers at TNO The Netherlands were the first to report bottom topography patterns in real aperture radar RAR images of the southern North Sea At that time this was a real puzzle The skin depth of microwaves for sea water is only of the order of centimeters while the sea bottom is about 20 meters below the surface Electromagnetic radiation therefore cannot probe the bottom directly Similar phenomena were found in radar imagery from SEASAT and SIR ALB synthetic aperture radars SAR s of Nantucket Shoals the English Channel and many other coastal areas Since then theory and ocean field experiments Le Phelps Bank Georgia Straits SARSEX TOWARD FASINEX etc have advanced our understanding considerably We now know that these surface signatures are the results of surface currents perturbed by the bottom topography which refract the propagation and modulate the energy of short surface waves so as to cause microwave backscatter power variations Hence any large scale ocean features containing nonuniform surface currents i e internal waves eddies fronts etc will cause similar manifestations in the radar imagery by means of current wave microwave interactions Observations confirm this
