

Radical Surgery

- The theoretical basis for radical surgery is that if you remove both the primary tumor and the seeds of metastasis in the adjacent lymph nodes, there should be a better chance of curing the disease.
- The most frequently used radical operation is radical mastectomy: the removal of the breast and a large amount of adjacent tissue including the largest chest muscle and the lymph nodes in the arm pit (axillary lymph nodes).
- This eighty-year old operation is the treatment of choice for "curable" breast cancer, regardless of the type, location or stage of invasion.
