Geology of Industrial Minerals , *The Effectiveness of UN Human Rights Institutions* Patrick J. Flood,1998-01-13 Since the 1970s the international community of states has demonstrated increasing willingness to invest UN institutions with politico ethical authority to act on its behalf in addressing human rights abuses Through trial and error some of these institutions have had a degree of success in securing better practical observance of international human rights standards Flood examines the reasons why some structural approaches have had more impact than others He argues that states must make policy choices in an environment where many political actors operate simultaneously and where several state interests are in play simultaneously This situation creates the political space in which community structures can operate to influence behavior Because states require the active or tacit cooperation of other states to promote their interests they seek to avoid prolonged political isolation Thus the most effective UN human rights institutions are those linked in meaningful ways with Charter based human rights mechanisms These mechanisms thematic and country specific have different structural advantages and their concrete effectiveness depends on the specific circumstances of the particular case they are asked to address There is evidence that they have greater impact when employed simultaneously as well as when key states support their efforts bilaterally Through case studies Flood analyzes the work of the thematic mechanisms on disappearances and religious discrimination and the country specific mechanisms used with Chile and Iran He concludes that Charter based UN human rights institutions have become an enduring part of the international environment and that their activities have strengthened the concept and practice of state accountability to the international community for human rights conduct **A Blues**

Origin of Igneous Rocks Gunter

Faure, 2013-03-09 his book is intended for graduate students of the Earth Sciences who require a comprehensive examination of the origins of igneous rocks as recorded by the isotope compositions of the strontium neodymium lead and oxygen they contain. Students who have not had a formal course in the systematics of radiogenic isotopes can acquire a basic understanding of this subject by a careful study of Chap 1. Additional information is readily available in a textbook by Faure 1986. The primary purpose of this book is to demonstrate how the isotope composition of Sr Nd Pb and O in igneous rocks has been used to shed light on the origin of igneous rocks and hence on the activity of the mantle and on its interactions with the continental and oceanic crust. The presentations are based on the premise that igneous and metamorphic rocks form as a direct consequence of the dynamic processes of the mantle and of the resulting interactions between the mantle and the crust. Accordingly Chap 2 to 6 examine specific types of igneous rocks that form in particular tectonic settings. Each of these chapters starts with questions about the properties of the mantle and crust and about the relation between the tectonic setting and the rock forming processes that take place in that setting. *U.S. Geological Survey Bulletin*, 1983
