

Dull to Glassy Minerals

Turquoise

A rare but very popular copper-bearing mineral

- Fairly hard; may be scratched with a pocket knife with some effort
- Blue-green and opaque, typically with a dull luster
- Generally forms as irregular masses or veins within cavities or cracks in rock
- Turquoise is very scarce; look in desert regions like the Mojave Desert along the Nevada border

How are they different?
Chrysocolla is far more common and widespread, but is also much softer

Chrysocolla

A soft and common mineral that forms when copper weathers

- Soft; easily scratched with a pocket knife
- Pale blue to bluish green in color, often growing on or with other copper-bearing minerals
- Typically forms as a thin powdery crust or coating; also can occur as veins or masses in rock
- Crusts of chrysocolla are most abundant in dry areas, such as along the southern Nevada border

How are they different?
Malachite is harder and exhibits a fibrous structure; chrysocolla is often crumbly

Malachite

An attractive and somewhat common copper mineral

- Soft; can be scratched with a pocket knife
- Vivid green in color; sometimes exhibits banding on edges or on cross-sections
- Forms as lumpy or fibrous masses or crusts on or near other copper minerals; rarely as hair-like crystals
- Look in desert regions, particularly the Mojave Desert along the Arizona border

How are they different?
Epidote is much harder and a bit more common; epidote is more yellow-green

Epidote

An uncommon mineral with distinctive color

- Very hard; can't be scratched with a pocket knife
- Virtually always a distinctive yellow-green or pistachio-green color, though can be browner
- Crystals are elongated with grooved sides; more common as opaque crusts, masses or veins
- Epidote is found in mountainous regions or along rivers, especially in the southern half of the state

Dull to Glassy Minerals

Jade

A favored green gemstone collected for centuries

- Fairly hard; may be scratched with a pocket knife
- Light to dark green in color, sometimes with gray or brown mottling and a "greasy" luster
- Found as irregular masses, often as rounded pebbles on coastal beaches
- Jade is found on Pacific Coast beaches, as well as along rivers in the Klamath Mountains

How are they different?
Jade is harder and scarcer; serpentines are not as frequently found on beaches

Serpentine group

A fairly common group of soft, "greasy" minerals

- Soft; easily scratched with a pocket knife
- Green to yellow or brown and typically opaque
- Forms as irregular masses, often with parallel grooves and a "greasy" feel; rarer serpentines appear as bundles of parallel fibers
- The Klamath Mountains, Coastal Ranges, and San Francisco Bay areas are lucrative areas

How are they different?
Serpentine minerals are harder than talc; talc can be scratched with your fingernail

Talc

Talc is the softest mineral, though it's somewhat uncommon

- Extremely soft; easily scratched with your fingernail
- Light-colored, white to pale green, and opaque, sometimes with a tan, weathered exterior
- Forms as irregular flaky masses that are chalky and feel like soap
- Talc is found along the Sierra Nevada and Inyo Mountain Ranges, both at outcrops and in mines

How are they different?
Talc is lighter in color and forms as large masses rather than tiny crystals or crusts

Chlorite group

Very common, very soft minerals found coating rock cavities

- Very soft; easily scratched with your fingernail
- Dark-colored in shades of green or brown, appearing "greasy" in luster
- Forms as thin coatings or tiny six-sided crystals within cavities in rock, particularly in basalt
- The Klamath Mountains and the Cascade Range produce chlorites in weathered rocks

Rocks And Minerals Of California
