Pseudodifferential Methods in Number Theory André Unterberger, 2018-07-16 Classically developed as a tool for

partial differential equations the analysis of operators known as pseudodifferential analysis is here regarded as a possible help in questions of arithmetic The operators which make up the main subject of the book can be characterized in terms of congruence arithmetic They enjoy a Eulerian structure and are applied to the search for new conditions equivalent to the Riemann hypothesis These consist in the validity of certain parameter dependent estimates for a class of Hermitian forms of finite rank The Littlewood criterion involving sums of M bius coefficients and the Weil so called explicit formula which leads to his positivity criterion fit within this scheme using in the first case Weyl's pseudodifferential calculus in the second case Fuchs The book should be of interest to people looking for new possible approaches to the Riemann hypothesis also to new perspectives on pseudodifferential analysis and on the way it combines with modular form theory Analysts will have no difficulty with the arithmetic aspects with which save for very few exceptions no previous acquaintance is necessary

Spectral Theory of Infinite-Area Hyperbolic Surfaces David Borthwick, 2007-09-13 This book is a self contained monograph on spectral theory for non compact Riemann surfaces focused on the infinite volume case By focusing on the scattering theory of hyperbolic surfaces this work provides a compelling introductory example which will be accessible to a broad audience The book opens with an introduction to the geometry of hyperbolic surfaces Then a thorough development of the spectral theory of a geometrically finite hyperbolic surface of infinite volume is given The final sections include recent developments for which no thorough account exists

Peter Lax, Mathematician Reuben Hersh, 2014-12-29. This book is a biography of one of the most famous and influential living mathematicians, Peter Lax. He is virtually unique as a preeminent leader in both pure and applied mathematics fields which are often seen as competing and incompatible. Although he has been an academic for all of his adult life, his biography is not without drama and tragedy. Lax and his family barely escaped to the U.S. from Budapest before the Holocaust descended. He was one of the youngest scientists to work on the Manhattan Project. He played a leading role in coping with the infamous kidnapping of the NYU mathematics department's computer in 1970. The list of topics in which Lax made fundamental and long-lasting contributions is remarkable: scattering theory, solitons, shock waves, and even classical analysis, to name a few. His work has been honored many times, including the Abel Prize in 2005. The book concludes with an account of his most important mathematical contributions made accessible without heavy prerequisites. Reuben Hersh has written extensively on mathematics. His book with Philip Davis, *The Mathematical Experience*, won the National Book Award in science. Hersh is emeritus professor of mathematics at the University of New Mexico.

An Introduction to the Langlands Program Joseph Bernstein, Stephen Gelbart, 2013-12-11. For the past several decades, the theory of automorphic forms has become a major focal point of development in number theory and algebraic geometry, with applications in many diverse areas including combinatorics and mathematical physics. The twelve chapters of this monograph present a broad, user-friendly introduction to the Langlands program, that is, the theory of automorphic forms and its connection with the theory of L-functions and other fields of mathematics. Covered are a variety of areas in number theory, from the classical zeta function up to the Langlands program. The exposition is systematic, with each chapter focusing on a particular topic, devoted to special cases of the program, and accessible to graduate students and researchers in the field.

Cohomological Theory of Dynamical Zeta Functions Andreas Juhl, 2012-12-06. Dynamical zeta functions are associated to dynamical systems with a countable set of periodic orbits. The dynamical zeta functions of the geodesic flow of locally symmetric spaces of rank one are known also as the generalized Selberg zeta functions. The present book is concerned with these zeta functions from a cohomological point of view. Originally, the Selberg zeta function appeared in the

spectral theory of automorphic forms and were suggested by an analogy between Weil's explicit formula for the Riemann zeta function and Selberg's trace formula. The purpose of the cohomological theory is to understand the analytical properties of the zeta functions on the basis of suitable analogs of the Lefschetz fixed point formula in which periodic orbits of the geodesic flow take the place of fixed points. This approach is parallel to Weil's idea to analyze the zeta functions of projective algebraic varieties over finite fields on the basis of suitable versions of the Lefschetz fixed point formula. The Lefschetz formula formalism shows that the divisors of the rational Hasse-Weil zeta functions are determined by the spectra of Frobenius operators on l -adic cohomology.

An Introduction to the Mathematical Structure of Quantum Mechanics F.

Strocchi, 2008. Arising out of the need for Quantum Mechanics (QM) to be part of the common education of mathematics students, this book formulates the mathematical structure of QM in terms of the C^* -algebra of observables, which is argued on the basis of the operational definition of measurements and the duality between states and observables.

The Spectral Theory of Geometrically Periodic Hyperbolic 3-Manifolds Charles L. Epstein, 1985. In this paper we develop the spectral theory of the Laplace-Beltrami operator for geometrically periodic hyperbolic 3-manifolds. Using the theory of holomorphic families of operators we obtain a quantitative description of the absolutely continuous spectrum.

Selected Papers II Peter D. Lax, 2005-05-20. A renowned mathematician who considers himself both applied and theoretical in his approach, Peter Lax has spent most of his professional career at NYU making significant contributions to both mathematics and computing. He has written several important published works and has received numerous honors including the National Medal of Science, the Lester R. Ford Award, the Chauvenet Prize, the Semmelweis Medal, the Wiener Prize, and the Wolf Prize. Several students he has mentored have become leaders in their fields. Two volumes span the years from 1952 up until 1999 and cover many varying topics from functional analysis, partial differential equations, and numerical methods to conservation laws, integrable systems, and scattering theory. After each paper or collection of papers is a commentary placing the paper in context and where relevant discussing more recent developments. Many of the papers in these volumes have become classics and should be read by any serious student of these topics. In terms of insight, depth, and breadth, Lax has few equals. The reader of this selecta will quickly appreciate his brilliance as well as his masterful touch. Having this collection of papers in one place allows one to follow the evolution of his ideas and mathematical interests and to appreciate how many of these papers initiated topics that developed lives of their own.

Regular Extensions of Hermitian Operators A. V. Kuzhel, S. A. Kuzhel, 1998-01-01. The concept of regular extensions of an Hermitian non-densely defined operator was introduced by A. Kuzhel in 1980. This concept is a natural generalization of proper extensions of symmetric densely defined operators. The use of regular extensions enables one to study various classes of extensions of Hermitian operators without using the method of linear relations. The central question in this monograph is to what extent the Hermitian part of a linear operator determines its properties. Various properties are investigated and some applications of the

theory are given Chapter 1 deals with some results from operator theory and the theory of extensions Chapter 2 is devoted to the investigation of regular extensions of Hermitian symmetric operators with certain restrictions In chapter 3 regular extensions of Hermitian operators with the use of boundary value spaces are investigated In the final chapter the results from chapters 1 3 are applied to the investigation of quasi differential operators and models of zero range potential with internal structure
