Mild Hypertension:

Mild Hypertension M. Weber, C.J. Mathias, 2012-12-06 There is clear evidence that in severe hypertension lowering blood pressure by drug therapy decreases the incidence of major cardiovascular events Recent studies suggest that such benefit may also extend to patients with mild to moderate hypertension The putative benefits of drugs may be offset however by their adverse effects and a prime example is the increased incidence of impotence and metabolic disorders in patients on thiazide diuretics There is therefore a real need to look further into the therapy of patients with mild to moderate hypertension The ideal drug in such patients would oppose the basic mechanisms responsible for the elevation in blood pressure would prevent counter regulatory responses and would have minimal side effects in both the short term and the long term the latter being of particular importance to younger patients These aspects were considered at the symposium Mild hypertension Current controversies and new approaches held at Titisee in West Germany October 13 15 in 1983 The foundation for discussion was set with an exposition of the neural and hormonal regulation of blood pressure in normal man followed by a consideration of the possible pathophysiological mechanisms involved in patients with hypertension Particular attention was focused on the central nervous system and on effects governed by activity of the peripheral nervous system as these may well provide further opportunities for logical therapeutic intervention in clinical hypertension The current management of mild to moderate hypertension was then reviewed

Primary Hypertension Werner Kaufmann, Gerd Bönner, Robert Lang, Karl A. Meurer, 2012-12-06 Some of the leading scientists in the field of hypertension accepted an invitation to actively participate in an international symposium on primary hypertension Scientists from 13 countries from western southern and eastern Europe Australia and the United States were present The meeting was held in Cologne in March 1985 After previous meetings and workshops at Titisee in the Black Forest and several symposia on the renin angiotensin aldosterone system here in Cologne this symposium on primary hypertension was organized in order to induce and to stimulate critical discussion on the basic pathogenetic mechanisms involved and the recently established therapeutic implications Numerous studies have been based on the concept that the elevation in blood pressure is mediated by several vasopressor substances For this reason the renin angiotensin system has been considered to be the essential endocrine mechanism involved in developing and sustaining arterial hypertension Other vasopressor factors such as catecholamines vasopressin and serotonin have been studied extensively and were assumed to play additional parts in blood pressure regulation However several other approaches have been initiated in recent years

Arterial Hypertension J. Rosenthal, 2012-12-06 It has been a little more than half a century since serious organized research on hypertension began Public and even physician interest in the subject remained minimal until the early forties and even then there were not more than a dozen fulltime investigators worldwide The first organization devoted to communicating regularly the results of hypertension research was created in Cleveland in 1945 it became the Council for High Blood Pressure Research of the American Heart Association in 1949 The early history of hypertension is not a story of progressive achievement Richard Bright is given great credit followed by Mahomed Allbutt Riva Rocci Bergman and Janeway but it was not until Volhard Fahr and Allen that some semblance of order emerged They were

followed by a younger much more vigorous group of investigators who in fact initiated modern research in hypertension Two more generations have followed In the course of some fifty years we have seen emerge a magnificent body of evidence that has prescribed good treatment and contributed a considerable understanding of the many complex mechanisms involved in the hypertension Treatment is now actively promoted by public health agencies including the World Health Organization

in Kidney Disease J.S. Cheigh, K.H Stenzel, A.M. Rubin, 2012-12-06 Blood pressure control is central to all bodily functions There are many points in the multifaceted cybernetic system wherein hypertension may be produced Hypertension is a young disorder whose existence has been known for less than a century It is not only extremely prevalent among every population but also deleterious to the health of mankind The more we understand about hypertension's harmful effects the more urgent is the need for its effective control The kidney is the central organ that controls vascular tone and body fluid volume these two factors are dominant in determining arterial blood pressure Hence it is not surprising to find in hypertensive disorders that there are abnormalities in the kidneys functional or anatomical subtle or overt that cause or are the consequence of hypertension The first suggestion that the kidney could cause hypertension was made in 1836 before arterial pressure could even be measured by Richard Bright He observed that cardiac hypertrophy was often present in patients who died of renal disease It was however Goldblatt and his colleagues in 1934 who opened the modern era of experimental and clinical research in renal hypertension Since then although far from complete enthusiastic and intensive research efforts have greatly improved our understanding of the nature of renal hypertension *Blood Pressure. Behavioral Epidemiology and Disease Prevention Robert M. Kaplan, Michael H. Criqui, 2012-12-06 In the United States and in Europe there has been an increasing interest in the relationship between individual behavior and disease The American National Academy of Sciences Hamberg Elliott and Parron 1982 through its Institutes of Medicine has estimated that as many as 50 percent of chronic disease cases can be traced to individual behaviors such as smoking diet exercise etc Similar conclusions have been reached by a variety of European investigators and institutes The World Health Organization has also expressed considerable interest in individual behavior in relation to the development of chronic disease Thus throughout the NATO countries there has been increased awareness of the relationship between behavior and disease However communication among investigators in different countries has been rather limited Further many different scientific disciplines including psychology sociology medicine microbiology statistics and epidemiology have all developed new and different literatures in this field One purpose of this book is to bring together contributions from scientists in each of these fields Much of the variance in individual health behavior occurs across countries rather than within countries Thus we can learn much from comparing behavior disease relationships across countries To date there have been few studies which have had an adequate international basis for these comparisons Interest in behavioral epidemiology is a relatively recent phenomena Thus many scientists are entering the field without uniform background experience or training This book discusses approaches common in a variety of NATO countries
