Genetic Variation and Dietary Response Artemis P. Simopoulos,P. J. Nestel,1997-01-01 This timely volume focuses on genetics and nutrition and their interaction in the development of chronic diseases Knowledge of genetic susceptibility to disease will not only help to identify those at higher risk for disease but also to ascertain their response to diet The prospect of targeting specific dietary treatment at those predicted to gain the most therapeutic benefit clearly has important clinical and economic consequences particularly in diseases of high prevalence This book is unique in considering genetic variation in susceptibility to disease and the importance of specific diets in influencing lipid levels in cardiovascular disease and bone density in osteoporosis The contributions emphasize that dietary response is dependent on the genetic variant and that specific dietary recommendations rather than universal ones are needed for the prevention and management of chronic diseases Bringing together vital information for the first time this book is important reading for physicians nutritionists dietitians geneticists physiologists molecular biologists food technologists and policymakers

Evolutionary Aspects of Nutrition and Health A. P. Simopoulos,Berthold Koletzko,1999-07 The issues treated in this publication are brought together in this way for the first time For many of the chronic diseases familial predispositions are well established and there is good evidence for true genetic predisposition When Homo erectus emerged 1 7 million years ago humans existed as non cereal eating hunter gatherers It is on this basis that according to the hypothesis of the carnivore connection an insulin resistant genotype evolved to provide survival and reproductive advantages to populations adapted to a high meat low plant food low carbohydrate nutritional environment Cereal became the major source of calories and protein in the human diet only about 10 000 years ago Humankind has thus had little evolutionary experience to adapt to this new food type maladaptation being the consequence Moreover studies comparing energy expenditure in Western societies and during the Paleolithic period indicate a low level of physical activity not previously encountered in human history a state to which humans are not genetically adapted Together with the dietary changes this has led to a modern environment in which a number of individuals are prone to chronic diseases causing increases in non insulin dependent diabetes mellitus hypertension coronary artery disease cancer and obesity As a consequence the lifestyle approach for the prevention and management of these diseases is essential varying with national dietary patterns and national economy This publication will be of special interest to physicians geneticists nutritionists dieticians anthropologists food technologists food policy makers and individuals interested in personal and family health
