Green Chemistry and Agro-food Industry: Towards a Sustainable Bioeconomy Stéphanie Baumberger, 2024-04-22 The objective of the book is to show the complementarity and integration of food and non food value chains for the development of a sustainable bioeconomy One current challenge facing industry and the economy is to meet the needs of a growing world population while preserving the environment The use of fossil energy resources for several decades has generated a decrease in reserves of these resources together with a phenomenon of global warming due to the release of greenhouse gases into the atmosphere More and more industrial sectors including the chemical industry are replacing fossil carbon with renewable carbon The bioeconomy consists in using renewable biological resources to produce food materials and energy A bioeconomy based on the green chemistry and biotechnologies is developing worldwide as a lever for reducing the ecological footprint of human activities The book is articulated around six parts each dedicated to a keystone of the interface betweengreen chemistry and Agro Food Industry

Alternatives to Conventional Food Processing 2nd Edition Andrew Proctor, 2018-01-17 This updated edition provides a review of the current major technologies that reduce energy cost and reduce environmental impact while maintaining food safety and quality Wildland Fire Behaviour Mark A. Finney, Sara S. McAllister, Jason M. Forthofer, Torben P. Grumstrup, 2021-11 Wildland fires have an irreplaceable role in sustaining many of our forests shrublands and grasslands They can be used as controlled burns or occur as free burning wildfires and can sometimes be dangerous and destructive to fauna human communities and natural resources Through scientific understanding of their behaviour we can develop the tools to reliably use and manage fires across landscapes in ways that are compatible with the constraints of modern society while benefiting the ecosystems The science of wildland fire

is incomplete however Even the simplest fire behaviours how fast they spread how long they burn and how large they get arise from a dynamical system of physical processes interacting in unexplored ways with heterogeneous biological ecological and meteorological factors across many scales of time and space The physics of heat transfer combustion and ignition for example operate in all fires at millimetre and millisecond scales but wildfires can become conflagrations that burn for months and exceed millions of hectares Wildland Fire Behaviour Dynamics Principles and Processes examines what is known and unknown about wildfire behaviours The authors introduce fire as a dynamical system along with traditional steady state concepts They then break down the system into its primary physical components describe how they depend upon environmental factors and explore system dynamics by constructing and exercising a nonlinear model The limits of modelling and knowledge are discussed throughout but emphasised by review of large fire behaviours Advancing knowledge of fire behaviours will require a multidisciplinary approach and rely on quality measurements from experimental research as covered in the final chapters The Lancet London ,1854 **Innovative Food Processing Technologies** ,2020-08-18 Food process engineering a branch of both food science and chemical engineering has evolved over the years since its inception and still is a rapidly changing discipline While traditionally the main objective of food process engineering was preservation and stabilization the focus today has shifted to enhance health aspects flavour and taste nutrition sustainable production food security and also to ensure more diversity for the increasing demand of consumers The food industry is becoming increasingly competitive and dynamic and strives to develop high quality freshly prepared food products To achieve this objective food manufacturers are today presented with a growing array of new technologies that have the potential to improve or replace conventional processing technologies to deliver higher quality and better consumer targeted food products which meet many if not all of the demands of the modern consumer These new or innovative technologies are in various stages of development including some still at the R D stage and others that have been commercialised as alternatives to conventional processing technologies Food process engineering comprises a series of unit operations traditionally applied in the food industry One major component of these operations relates to the application of heat directly or indirectly to provide foods free from pathogenic microorganisms but also to enhance or intensify other processes such as extraction separation or modification of components The last three decades have also witnessed the advent and adaptation of several operations processes and techniques aimed at producing high quality foods with minimum alteration of sensory and nutritive properties Some of these innovative technologies have significantly reduced the thermal component in food processing offering alternative nonthermal methods Food Processing Technologies A Comprehensive Review Three Volume Set covers the latest advances in innovative and nonthermal processing such as high pressure pulsed electric fields radiofrequency high intensity pulsed light ultrasound irradiation and new hurdle technology Each section will have an introductory article covering the basic principles and applications of each technology and in depth articles covering the
