Highly Enriched Uranium Use in Fuel for Civilian Research and Test Reactors, 2016-03-12 The continued presence of highly enriched uranium HEU in civilian installations such as research reactors poses a threat to national and international security. Minimization and ultimately elimination of HEU in civilian research reactors worldwide has been a goal of U.S. policy and programs since 1978. Today 74 civilian research reactors around the world including 8 in the United States use or are planning to use HEU fuel. Since the last National Academies of Sciences Engineering and Medicine report on this topic in 2009 28 reactors have been either shut down or converted from HEU to low enriched uranium fuel. Despite this progress the large number of remaining HEU fueled reactors demonstrates that an HEU minimization program continues to be needed on a worldwide scale. Reducing the Use of Highly Enriched Uranium in Civilian Research Reactors assesses the status of and progress toward eliminating the worldwide use of HEU fuel in civilian research and test reactors.

**Reduced Enrichment for Research and Test Reactors**, 1991 **Proceedings of the 1990 International Meeting on Reduced enrichment for Research and Test Reactors** Argonne National Laboratory, IL., 1990 International meeting on reduced enrichment for research and test reactors, 1993 **Irradiation Testing of Miniature Fuel Plates for the RERTR Program. [Reduced Enrichment Research and Test Reactors]**, 1981 An irradiation test facility which provides a test bed for irradiating a variety of miniature fuel plates miniplates for the Reduced Enrichment Research and Test Reactors RERTR program has been placed into operation. These tests screen various candidate fuel materials on their suitability for replacing the highly enriched uranium fuel materials currently used by the world's test and research reactors with a lower enrichment fuel material without significantly degrading reactor operating characteristics and power levels. The use of low uranium enrichment of about 20% <sup>235</sup>U in place of highly enriched fuel for these reactors would reduce the potential for <sup>235</sup>U diversion. The irradiation test facility designated as HFED is operating in core position E 7 in the Oak Ridge Research Reactor ORR a 30 MW water moderated reactor. The miniplates will achieve burnups of up to approx  $2.2 \times 10^{27}$  fissions/m<sup>3</sup> of fuel.
